> <www.k4oah.com>
>
Gary,

My apologies, I am unable to see an attachment either here or in the email.

R42, R43 and R44 appear to go from either pin 1 or pin 7 to RFC 3 choke off to the side terminating at the chassis and are a value of 68 ohm. Is this the placement of the resistors of concern? Is the placement of the 15 ohm resistors correct across pin 3 and 9? Should these 68 ohm resistors along with the 15 ohm resistors be replaced with the ohmite OY series resistors. Prior to replacement, I want to make sure that I am replacing the correct resistors.

I sincerely apologize for my lack of understanding; in addition my schematic is very hard to read.

Well here's a new thing. I double checked everything and noticed that after I cleaned everything, the audio is there, matches my Flex, but the meter is not moving. That seems to be the intermittent problem. It may have been coincidence that both were going on, but not the same problem. Sometimes the meter will respond but mostly not. In standby the meter travels right as should, with the rf gain the meter will go to about 40db.
Would this be the agc, though no changes with setting that differently. Also, I do have 1500 filter and selecting that makes no difference as well. All bands are affected. On AM it's a little better, but it only reacts to very strong signals. S9 on my Flex barely moves on the R4C in AM.
Thanks
Jerry K9GAS

>
>

Hi Steve,

You're not even close, I don't think...

The R-4 was the predecessor to the long line of R-4 derivatives that followed. i.e. the "A", "B", & the "C" versions. I understand that it's closest kin is the Drake 2B receiver.

I'm sure that Garey can shed a LOT more light on the subject than I am able to!

BTW, I have an R-4 here---and I LOVE it.

Jerry -

Possibly a bad meter connection?? Do NOT remove the nuts from the meter terminals. There is only
one per bolt and if the bolt is allowed to turn it can break the wire internally. The S-Meter
measures the current differential between V2 Plate and Screen, vs the V4 Plate and Screen current in
abridge. Check the Cathode voltages of both tubes.

12363. Repost of earlier Title "Drake 4 needs home and TLC"

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-05 17:42:37 UTC
From: daveincaol
Topic: 12363 Message: 12363

I've deleted the tags to get rid of the Rich Text.
The result wasn't readable when I reviewed it today.

The son of GM3XIJ (RIP) has asked me to sell on rigs from his Dad's shack.
He had a Drake 4 Station which consists of a T- 4XB S/N 15121G, R-4A S/N 6807B, MN-4 S/N 982, C-4 S/N 327 and a MS-4.
He seems to have had power supply difficulties and has made notes re a 'new power supply' which I don't have. The station appears to have been replaced with a TR-7 and P/S which I also have.

The equipment is not in pristine condition.
The upper horizontal chassis plating is corroded on both RX and TX. All other surfaces are bright and shiny. All tubes appear to be in position. The cases mostly need a refresh and in places possibly a repaint. The facia, dials and knobs are mostly good, the tens, units and second dials on the C-4 clock are discoloured and the clock is probably the 50c/s version.
The exception is the MN-4 which is in very good condition and was likely retained in the shack alongside the new TR-7
I have lots of photos I can upload if someone tells me how or that I can email once I have an address. I can take more from any desired perspective.
If all 5 packages were delivered to the same USA address then the total carriage would be of the order of $170. Separately the carriage would be of the order of $70 each package.
Given the above information and the need for work and restoration I believe they would benefit by being repatriated to where there is an active interest in the equipment.
I don't know how much they might be worth and will have to check any offers against completed sales on FeePay.
I would appreciate any advice and comments.
Thanks
DaveB GM6WCF

12365. R-4 Arrived!

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-05 20:45:17 UTC
From: Steve Wedge
Topic: 12365 Message: 12365

All I can say about this rig is, WOW!

The R-4 I bought from the auction site arrived today unmolested by the shipper. The seller had represented "I plugged it in, turned it on and nothing happened." Yep: looked at the fuse and it was blown. Got a replacement into the holder, crossed my fingers and fired it up...

Eureka!

The fuse didn't blow, and I was greeted to a nice blue glow from both windows - meaning that this set has pretty low hours on it. Cosmetically, this radio and its speaker are both 9/10, easily. Not one spot of corrosion on the chassis, the original inspection test tag is still on the power cord (which is still shiny and supple), indicating that it was tested on St. Patty's Day of 1965. There's also an Allied tag on it with "R4 0936" on it, so the original owner probably bought it from Allied.

Cosmetically, it's going to need dust removal (not bad, actually), a new red thing on the dial window and a knob-cleaning.

Electromechanically, the PTO is a little stiff and the PBT slugs aren't moving at all when I turn the PBT, meaning the grease is dried out. Even so, I'm listening to 15CW with it right now and though it needs the RF stages re-peaked, it sounds great!

The PRESELECTOR isn't nearly as touchy as I expected it to be, given that it doesn't have the reduction drive.

The sound is great with no hum at all. Nice, clean tones coming out of the speaker!

I located the INJ jack right next to the premixer on top of the chassis. It will be interesting to hook this up with my T-4XB and see what it will do.

Nice receiver.

12369. Drake AUX7 Sustitue by G3OKA

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-06 12:56:49 UTC
From: Clive
Topic: 12369 Message: 12369

Hi does anyone on here have any information on a Drake AUX7 Sustitue by G3OKA. I have tried to track down G3OKA but cannot find an email for him. It appears to be a simpler version of the AUK7 (no Crystal facility) with provision of a a matrix of diodes but I need the information on the layout for the diodes. Any help would be most appreciated.

Here's a link to my article on the same subject from some time ago:
http://www.wb4hfn.com/DRAKE/DrakeArticles/TechTips/Homebrew_AUX-7.htm

Included are links to the information sources I used as well as part numbers for the headers. At the bottom of the document you'll find a link to one of W8PU's articles with the details of the diodes required for the bands you want to cover. Note that the original Drake AUX7 modules were made in the same fashion with diodes selecting the frequency ranges needed.

For those who have not used an AUX board: If you construct modules to cover the WARC bands, you can switch to the correct VFO frequency by just using the AUX switch - you won't have to hit the UP and DOWN buttons to get the right range.

I have a similar problem with my C-line were the audio or receive gain drops to about half from time to time while the rigs are warming up. In order to bring back the gain to normal I have to cycle the transceiver switch on the T4XC, but once everything has warmed up they seem to work just fine. I gave up trying find the problem maybe someday it will finally die and I'll be able to locate the culprit.

Good Luck

That seems to be the intermittent problem. It may have been coincidence that both were going on, but not the same problem. Sometimes the meter will respond but mostly not. In standby the meter travels right as should, with the rf gain the meter will go to about 40db.
> > Would this be the agc, though no changes with setting that differently. Also, I do have 1500 filter and selecting that makes no difference as well. All bands are affected. On AM it's a little better, but it only reacts to very strong signals. S9 on my Flex barely moves on the R4C in AM.

I have occasionally had a problem with an R4B and T4XB
that may be similar. It seems to be the T-R relay in the
transmitter no fully un-muting the receiver. Cleaning the
contacts will help. Another possibility is that one or the
tubes is not making good contact in its socket. Try cleaning
both with contact cleaner. Work the tubes in the socket
with the cleaner. There is, of course, the usual voodoo of
working all the screws since some are used for grounding of
the circuit. This seems to be a universal problem in older
equipment.

12377. TR7 24V power supply board issues

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-06 13:12:19 UTC
From: robbydot
Topic: 12377 Message: 12377

Hello Group,
I have a TR 7 thats causing me some issue at the moment, particularly the power supply board. After removing the board and checking it I have 10 V out of the 723 and pass transistors (which is adjustable) and 5 volts out of the 5 V reg connected to the 10 V rail.
I have 10 v feeding the 2 TIP 31's but thats where the problems start. I have no oscillation and hence no 24 volt or -5 volt rail out of the board. The transformer meters out fine and is intact, the I & E core is complete, the tip 31's were replaced as one showed a very low gain compared to the other one, the 24 volt reg was fed with 26 volts and gave 24 volts, the bridge rectifier checks ok and the diode and inductor on the -5 volt rail checks ok ....
I have changed all of the electro's as well, photos before and after to ensure they went back in the same way as well as the same spot...
When I'm checking for the -5 and 24 v rails I am using the second earth, pin 3 on the board, not pin 12 which is for the 5 & 10 volt rails
Another thing is there are 2 68 ohm resistors in parallel with the 15 ohm resistors on the TIP31's... I have disconnected them and reconnected them to see if that makes a difference, it doesn't... I cant see any reference to them in the service manual so I am not sure if they are a factory mod or a cludge...
If anyone has any further idea's or suggestions on what I am missing they would be greatly appreciated...
Thank you Group,
73's
Rob VK3BRS

12381. AC-4 rebuild

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-06 16:34:18 UTC
From: Paul Kraemer
Topic: 12381 Message: 12381

Several weeks ago I decided I wanted a longer cord on one of my AC-4 supplies. Not the power cord, the one to the T4X.
I thought about just making an extension dongle but decided more plug and socket connections was not a good thing, it needed to be a special longer cord. Since someone needed my old standard cord it was an easy decision to share that one and make a longer one for my supply.

Then, I thought I may as well recap the old supply even though it was working fine and change the 2 wire power cord for a 3 wire grounded type. One thing led to another and I decided to replace the old disc ceramic capacitors on the ac line for the proper safety types and add an MOV across the line for transient protection.

I ordered some radial lead electrolytic from Mouser to do a re-can job and started carefully removing the old cans. About the time the new capacitors showed up I started thinking why not just do a layout of two circuit boards that fit over the can capacitor spaces, mount to the same holes, and provided easy access to the existing transformer leads as well as being very well ventilated and easy to install and service.
The end results are shown on this Photobucket link
http://s358.photobucket.com/albums/oo28/ee_design/AC4REBUILD/

A few friends knew what I was doing and the word of mouth receptiveness has been very gratifying. So much so that I have decided to offer my AC-4 rebuild kit as shown, completely assembled, for a very limited time price of $49.95 each plus postage. The target price after that will be $59.95 plus postage.

The kits are constructed of the same industrial grade components we use in our industrial electronic controls, FULLY ASSEMBLED and TESTED and supplied with color coded leads where needed for easy connection to existing, or should I say remaining, Drake components. Necessary mounting hardware is also included as well as a bonus feature of new line rated bypass capacitors and a 130 volt MOV for transient protection. If you need a new 3 wire cord I want to have those available as well. One stop shopping.

Will the kit fit an AC-3? I believe it will. I have not tried it yet but I can see that the two boards mounted side by side will fit the space available. You will have to drill a few 3/32" holes in the AC-3 chassis to line up with the board mounting holes which were positioned for the AC-4 layout.

I am offering these kits as an alternative option to those who appreciate the wide open architecture of the layout, ease of installation, and serviceability should it ever be required. They are covered by the same generous warranty we provide all our industrial customer. Lifetime on

workmanship and 1 years on parts.

All that said, I have sold out my pre production units about three times over and have production quantities on order. Units should be available for shipping the March 22 give or take a day or two.

Thank-you
Paul K0UYA

I understand, but I think that there are other solutions that would keep those sections open for all to post. I manage a few Yahoo groups and I usually just terminate the offenders. If someone is getting stuff posted and are not members of the group, maybe the Yahoo folks could sort that out. Anyway, it's more trouble than it's worth to have to go through someone else to post items. I'll just post them elsewhere. Thanks for the explanation.

Floyd -

I'm sorry you feel that way..... I value your contributions, and I thought friendship.

There doesn't appear to be a way to limit posting to files or links without limiting them to Owner
and Moderators. This has happened a couple of times before, and each time it's someone who joins,
loads their junk, and un-joins. I don't check the files and links every day to see what may have
been posted, and I think you know as well as I do that Yahoo really doesn't have much interest in
modifying their 'product'.

If you have your material ready to upload, let me know and I'll unlock whatever you wish. I usually
only leaveit locked for a day or two, but this just happened a few days ago.

As I'm sure you know, I don't have much tolerance for 'reflectorwars', and want everyone to feel
welcome.

I agree there are better ways to address this than shutting the files section down from user uploads.

The NUMBER ONE thing you really should do to cut down on spam and subsequently inappropriate file uploads, is to keep the spoof emailers from getting in to start with. How is this possible you ask? Change how people join the group. It is currently set up so that anybody can join with just the click of a mouse, and have full access immediately. This needs to change. Change the group settings so that someone is required to send a note to the owner/moderator at sign-up, (say, requiring a callsign and/or brief description of the equipment they own), which then requires one of you to "accept" their membership. Most other yahoo groups I belong to are set up in this manor.
If that's not enough, you can also set it so that new members are placed on moderation for say, the first three posts. If their first post is smut, you'll catch it and be able to dump them before it reaches all our inboxes. I believe you can also moderate files uploads in this same manor.
Some or all of the above would dramatically reduce the amount of spam we ALL receive, and spoof file postings.

Hi Chris...

Everything you suggested is already in place in DrakeRadios.

As a moderator, the suggestions that file uploads should be allowed, creates far more work for the owners and moderators than you can imagine. Occasional trash file uploads are more common than you could possibly imagine. I would rather be inconvenienced by being asked to post something to the files, than spend all day deleted and chasing down errant members and/or their trash files to a group.

As Garey said, if someone wishes to upload a file or a group of files, we would be more than happy to allow that to happen. Just let one of the moderators know and we will work with you.

Chris -

I have been moderating and using Yahoo groups since the 'beginning'. They have always been set up
to 'joinwith a click' and Yahoo provides for an individual block on Posting. So anyone can joinwithout waiting for 'approval',yet the list is protected against SPAM transmissions. If their
first attempt at a post is junk, it is dumped, and so are they.

Unfortunately, there is no INDIVIDUAL blocks for FILES or LINKS or PHOTOs, only group permissions.

The only line of defense left is individual 'approval' of membership, which frankly is more work for
the moderators for very little return. This is only the second time in several years that I have
suspended upload permissions, and the last time no one even noticed the 3-5 days it was restricted.

Strange. I have a Yahoo group that I started about 5 years ago. This kind of thing has never happened to it. The closest I've come to that is someone's email was hacked and some messages from a good member were posted but that was obviously not the member's willful doing.

Maybe it has something to do with the popularity of the group? Anyway, thanks, Garey, for all you do with/for the group. It's all good.

12391. TR-4Cw VOX problems

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-06 21:23:18 UTC
From: slowcountry1
Topic: 12391 Message: 12391

With the vox control fully CW and anti-vox fully CCW, if I loudly whistle or tap the mic on the bench, I can activate VOX and then it will drop right out. With PTT depressed, transmit audio is good, with sufficient audio. With the PTT not depressed, if I stick my ear to the speaker, I can hear the mic if I tap it on the bench however; I cannot hear my voice.

I replaced V19 6FQ7 to no avail. For smiles and grins, I replaced V18 12AX7. As discussed on someone else post, I measured the cathode of D5 and saw 10.3 VDC. I checked pin 2 of V19 and read -9.057VDC. If I tap the mic on the bench, pin 2 will go to zero. It takes a very loud noise to trigger the VOX.

Any other suggestions to activate VOX. I am using the factory Drake hand mic that used to operate VOX quite nicely. Again, this rig has been on the shelf 8 year plus since I have used it. BTW, I'm aware taping the mic on the bench is not a good thing.

Thanks,

Doug

Doug -

Try bridging an electrolytic across C145C. I think you should be seeing a higher DC voltage onCathode of D5 when you whistle into the mic. By the way, whistling is better for the mic than
driving nails with it! :-) This DC voltage is supposed to charge C143 to full voltage immediately, and then be dischargedover a second or two via R106. If you disconnect R106 the
voltage should stay up across the C143 for longer. R106 is selected for VOX DELAY. It's possible
that C143 is leaky, although not likely.

12394. The Heathkit Shop AC4R rebuild kits

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-06 22:45:32 UTC
From: qrper
Topic: 12394 Message: 12394

Gang,

My wife and I talked it over.

One bad apple shouldn't ruin things for everyone.

Late March, early April, I'll have plenty of AC4R kits ready to go. A new batch of pcbs have been ordered and they should be in here within two weeks or so. The same goes for the Heathkit HP23RL

I placed a large order of parts from Mouser and Digikey yesterday.

I plan on making a youtube video of how to build and install the pcb. That's going to be a hoot.

Also, and this may or may not fly, I'm working with a company to make a new cover for the AC4. This cover will be designed to increase cooling via two 60mm fans and improved vent holes. It will be made either of aluminum or steel (it's a special type that won't rust!)

It will come with the fans, hardware and maybe a small circuit board for stealing the ac from the filament string. It maybe just a terminal strip and parts. At lot will depend on the cost of the metal work.

Price? I can't say.

Won't get the quote back for several days.

Right now, is there enough interest?

What's the price point? I don't know...

Anyway, thought I jump in here and let everyone know that will be back.

Mike, wb8vge

Gary,

Again, you will have to excuse my ignorance. From my schematic, I see C145C as the multiple cap at the front of the radio in front of V18 as 10uf 50V. I have already replaced this with the set from Hayseed Hams. As new caps can be bad, I bridged pin 8 of V19 to ground with a 10uf electrolytic as suggested.

First I need to make sure that I am looking at the correct diode for D5. I see this coming from Pin 6 of V19 on a vertical board next to V19. I stated that I had a +ve voltage of 10.3VDC on the cathode of the diode however; it is actually a -10.3VDC that goes to 0 on a heavy whistle. I really have to make some noise for it to register.

I see C143 being a yellow 200VDC cap on the same side of the board as I see D5. The 3.3K shorting resistor R106 I see on the opposite side of the same board.

I took a picture of the board that I am looking at for reference.

Again, I greatly apologize for all of the remedial questions however; I need to make sure I am looking at the correct components or none of this will fit together. I am very appreciative of your assistance.

Doug

Gang,

My wife and I talked it over.

One bad apple shouldn't ruin things for everyone.

Late March, early April, I'll have plenty of AC4R kits ready to go. A new batch of pcbs have been ordered and they should be in here within two weeks or so. The same goes for the Heathkit HP23RL

I placed a large order of parts from Mouser and Digikey yesterday.

I plan on making a youtube video of how to build and install the pcb. That's going to be a hoot.

Also, and this may or may not fly, I'm working with a company to make a new cover for the AC4. This cover will be designed to increase cooling via two 60mm fans and improved vent holes. It will be made either of aluminum or steel (it's a special type that won't rust!)

It will come with the fans, hardware and maybe a small circuit board for stealing the ac from the filament string. It maybe just a terminal strip and parts. At lot will depend on the cost of the metal work.

If you've gone to this length, how much more trouble would it be to source a transformer

and offer a complete kit for those that don't have or need an extra power supply? The prices on e-pay may make it a wonderful alternative to a number of hams?

Gang,

My wife and I talked it over.

One bad apple shouldn't ruin things for everyone.

Late March, early April, I'll have plenty of AC4R kits ready to go. A new batch of pcbs have been ordered and they should be in here within two weeks or so. The same goes for the Heathkit HP23RL

I placed a large order of parts from Mouser and Digikey yesterday.

I plan on making a youtube video of how to build and install the pcb. That's going to be a hoot.

Also, and this may or may not fly, I'm working with a company to make a new cover for the AC4. This cover will be designed to increase cooling via two 60mm fans and improved vent holes. It will be made either of aluminum or steel (it's a special type that won't rust!)

It will come with the fans, hardware and maybe a small circuit board for stealing the ac from the filament string. It maybe just a terminal strip and parts. At lot will depend on the cost of the metal work.

Price? I can't say.

Won't get the quote back for several days.

Right now, is there enough interest?

What's the price point? I don't know...

Anyway, thought I jump in here and let everyone know that will be back.

Mike, wb8vge

Doug -

D5 is on the same board as C143, withit's Cathode lead tied to the terminal at the topof the board,
same as C143.

What is supposed to happen is that audio from the MIC AMP stage is applied to the Grid of V19a (Pin
7 from the wiper of the VOX control. It is ampllified and coupled out of the Plate of V19a (Pin 6)
via C141 to the Anode of D5. The AC signal is rectified by D5, making positive pulses that are
integrated in C143. The Grid of V19b is normally held slightly negative to cut off current through
that section. When a positive voltage is developed across C143, it is enoughto overcome the negative
voltage on the Grid, driving it positive and causing V19b to conduct heavily, pulling the the relay.
R106 discharges C143 so that in the absence of audio the integrated voltage drops to zero,

allowing
the negative bias to again cut off V19b, and releasing the relay.

The ANTI-VOX takes a bit of signal from the receiveraudio and it is rectified by D6 and the resultant _negative_ voltage is integrated in C144 and used to balance the VOX signal. This is to
prevent audio from the speaker tripping the VOX circuit on in receive.

Thank-you very much Brian
I will be receiving more boards in two weeks and all other parts are on the way
With our assembly process it takes very little time to stuff and wave solder them. Test and package takes longer.
You are definately down for a set
I am going to get to work on best cost USPS shipping tonight so I can get back to everyone on that. It's always the little insignificant things that slows the process. I could just round up but I want to be as reasonable as I can.
Thank-you again
Paul

Not to drag this out, but let me also add that approval of membership is a major turn-off for technical people. The Internet-savvy world is almost entirely open access, and it's very tempting to just say "whatever, forget it" when presented by a meat barrier. I know there are several yahoo! ham groups I have tried to join in the past that required manual intervention for joining and did not even allow non-members to read the list pre-approval. It's cold comfort that some spam might be stopped when the moderator takes a few days (!) to approve your application, and by then you've forgotten what you wanted to search the list for anyway. ;-)

For whatever it's worth, I think this list has a very high signal to noise ratio, so you guys must be doing something right.

I've been lurking and reading and I applaud the moderators of this list for keeping the spam and porn off it. I belonged to another listserve, where the moderator dropped off and Yahoo would not accept another moderator without her approval, no one could get it. In the meantime it became totally unusable because of the porn. We started a new moderated group. The Heathkit group, this Drake group, the Hallicrafters Group, the Johnson group, and many others on the music side I belong to, all had membership approval gates. If you want the information bad enough you'll use the proper proceedures and go through the membership gate and forward you photos to the moderator for posting...it's that simple. Again...good work moderators...hats off to you for keeping this site safe!!

Gary,

Thank you for all of the information. I was looking at the correct diode, cap and resistor. Anode of D5 is -10VDC + or - with no VOX activity and drops to zero when I can actually get the VOX to kick in. I will have to do some investigating and try to figure out what is happening here.

Thanks,

Doug

Hello again Group,

Just a heads up, the TR7 is now working fine... It must have been the low gain transistor because after swapping it out things just started working again... Possibly a dodgy connector joint ?

Thanks group,
73's
Rob.

Hi and thanks for all the replies. I appreciate the effort.

I am actually looking for specific information on the G3OKA board it does not employ diode modules on DIL carriers!

I have uploaded a picture to the Photos section of the site. It's under G0PPO.

I would appreciate any assistance for this board. Diode layout, etcetera!

Thanks again and 73 Clive g0ppo

I've rather thought the AC3 NEEDS a cover, especially with the PCB refits,
just for electrical shock safety. Not every ac3/4 is mounted in a speaker,
many, if not most are loose on a shelf. Does the AC4 need better cooling?
this may also depend on mounting in a speaker. Thanks for providing for
this needed product, btw!

A custom cover for the ac3 wouldn't be a bad idea. However the engineering cost, setup fees, and so on would make it prohibiting.

I won't know what the price will be for my proposed ac4 cover for a few days.

Iam thinking the whole shebang can be under $35 for the cover, two fans, all hardware, labels/silkscreen, and components to run the fans.

It will NOT be painted or clear coated.

I agree that the AC3 needs a protective cover over any aftermarket
electronics on top of chassis
I was looking at that last night when asked if my new AC4 rebuild kit would
work with the AC3. Since the boards mount in a horizontal profile on top the
chassis it would be easy for me to offer additional standoffs to mount the
board which would then support a perforated aluminum cover over the boards.
I'd use the same 0.050" thick perforated aluminum stock I use for the S line
replacement speaker grills. Just like Collins did over the bleeder resistors
in the 516F-2.
Problem resolved

12418. Re: [DrakeRadio] AC-4 Supply in the UK and relisted Series 4 eqpt.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-07 15:16:18 UTC
From: David Ball
Topic: 12418 Message: 12418

Hello Keith

I haven't had a lot of luck locating an AC-4 at an affordable price. As far as I can determine after some research the likely selling price of the T-4 in its present condition would be a lot less than the total price for a PSU.
At some time in the future I'll decide how to dispose of the T-4.
One offer I did get was the exchange a PSU for the R-4A plus cash, but I'll give that a miss. A R-4A refurbished to collector condition has the potential to be the most valuable item of the lot. So that one will go on my 'to do' list.
The C-4 has sold to a UK buyer at an agreeable price.
So really all that is left for the moment is the MN-4 and the Speaker.

Thanks for your help

DaveB

I have a TR-7 and PSU for disposal ex the estate of a bygone ham. (GM3XIJ).
Externally the rig is very clean and has just one scratch on the cover side. The 'internal' condition is presently unknown but I have arranged to take it and several other pieces including a R-4A to my nearest Radio Club in two weeks for testing. After that visit I can post more details.

Any interest or advice let me know.

DaveB (Ex GM6WCF)

12421. AC3 Cookie Sheet cover

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-07 15:57:19 UTC
From: Kris Merschrod
Topic: 12394 Message: 12421

I wish that I had taken a photo of it, but I had an AC3 and felt that it needed a cover so I "borrowed" an aluminum cookie sheet from the kitchen and carefully made a U-shaped cover. I did not have a sheetmetal bend and the main decision was "Tefon in or teflon out?" If I remember well, the screws that hold the bottom on were used to secure the cover. It was a bit tall so there was venting from the top ends.

A little more effort could have been put into it with vent holes - I like the idea of using perfed sheet metal. I would have done that but my wife's inventory was limited! :<)

Should be easy to do
McMaster Carr has the perf metal
Inexpensive tall standoffs can be some 10-24 threaded rod, nuts and a small diameter tubing
Doing it that way relaxes the tolerance over trying for a good fit to the chassis

This is posted at the request of Ron, WB4HFN.

Mike has made several announcements lately about returning to production soon, and so far at least
they will be available ONLY from theHeathkitshop.

****
To everyone on the list looking to purchase the AC4 upgrade
kit.

In the last couple of weeks I am receiving numerous e-mails
daily wanting to purchase that AC4 Upgrade Kit.

I reply that I DO NOT sell that kit, it is ONLY available
from the Heathkit Shop. To those that feel the need to get
rude and nasty, that doesn't help since I DO NOT sell the
kits in the first place.

To Repeat:

I DO NOT SELL THE AC4 UPGRADE KITS.
I DO NOT SELL THE AC4 UPGRADE KITS.
I DO NOT SELL THE AC4 UPGRADE KITS.

I am waiting to purchase kits just like everyone else.
If you cannot wait like everyone else, I suggest you throw
your AC4 in the garbage and buy a new radio.

Ron / WB4HFN

Garey,

Today, I bridged the C145C with a 45uf cap instead of a 10uf cap and that produced no results. I looked everything over and I'm not finding a culprit. For smiles and grins, I removed R106 from the circuit however; it did hold the relay in a little bit longer but not much. It actually measured 3.7K instead of 3.3K. I soldered it back in. For some reason, to which I cannot explain, the VOX will now work with normal voice however; the VOX gain has to be turned all the way CW. Any movement off full CW and it will not work.

Doug

You should be able to work it out from an the matrix chart in the AUX-7
instructions and the AUX-7 schematic in the TR-7 service manual.

Possibly. That's a common issue with 7-line radios, and affects all the plug-in boards. The female contacts on the plug-in boards can also lose thier "spring" and fail to make good contact, but that seems to be less common.

Another thing to watch for is clearance between components and the back (top) side of the female connectors. The male pins pass completely through the connector shell, and can portrude a small distance out the other side when the board is fully seated. A component that is bent too close can short to the pin. Again this is rate, and is usually caused by somone poking around on the board.

I agree with Jim. At least with Yahoogroups, the owner/moderator(s) can request a short statement of the reason that the person wants to join. On some of my lists, they still run on the Mailman software. I remember when I was new at administering the lists, the software didn't allow individuals to be moderated - only the entire list. Talk about extra work for the moderator, having to approve each message!
Until someone is in our shoes, it's impossible to convey what we have to contend with.

For example, I have been deluged for a few weeks with bogus membership requests. In some, it's obvious that the e-mail address is bogus; it's just a sequence of random letters that makes no sense.
Others have a totally mismatched e-mail address and user name.

Normally I ask for a callsign, if one is not given along with the membership request or is not in the e-mail address.
Being asked for a callsign may scare some off. Others get downright offended, even though exchanging callsigns is the first thing we do in a QSO.
But if someone can't be bothered to reply with this minimal information, I consider it their loss.

Having spent a long time as the moderator, of a very busy BBS, that frequently had very contentious discussions, I have a great deal of respect, for what the moderators go through, to put out a product, as good as this one. One of the other reflectors, to which several of us here, also belong, really raises my hackles, at times, by being too heavy handed in it's moderation. Perfectly good, and informative threads get shut down, because they stray, slightly, from the topic, of the brand of radio, at hand, while others, are allowed to go on, when each is as good as the other.
That is what makes this reflector so good. Perfectly good, but somewhat off-topic threads can usually run their course, without heavy handed policing.
A note of thanks, to those responsible for making this, the great forum, that it is.

This is straying off-topic, but one of the nice things about running an SMF forum is that there are some pretty nifty automated defense systems I can install as mod packages. I did so a couple of years ago after the "spring flood" of spammers, and since then have only had to deal with not more than about 5 bogus signups a month. The logs show that the defenses have blocked tens of thousands of malicious attempts, and that's only the ones that get logged (I can get a general idea of the rest on the Project Honeypot page).

Yahoo has a few lessons to learn.

Hi Garey
Checked the 24v supply from power board and got a steady reading of 23.9 on my DVM.
The situation I have now is (band switch at 20m)when I first switch on the VCO locks and get good sigs and I can switch down to 40, 80 etc and it remains locked and sigs OK. But if I switch to 15m it goes out of lock. Switching back to 20m I now find that has gone out of lock as well. But (still on 20) I switch the rig off and on and it comes back into lock on all the lower bands. Switch up to 15 it all goes out of lock. Totally lost on this.

Cheers

OK.... It's kinda funny that the only 'complaints' or 'suggestions' about how the list is run
surfaced after ONE member complained he was unable to upload a file! :-)

We must be quite fortunate in operation of the list, because I certainly don't know anything about
running one, and no offense, but I don't think Joe is far ahead of me. We were asked to take over
the list when the originator lost interest and didn't want it to die. The 'other' list is the
opposite of over-moderated, e.g., 'the list isn't working', answer: (if any) 'so? can't help you'.
So I thought it was worth saving and running in parallel, and apparently so did Joe.

This was four or five? years ago, and it's been running pretty good. We are fortunate to have ~975
adults (sorry Jim!) who know how to use a delete key when something offends their sensibilities,
ratherthan complain _to the list_ about my failings.

After several years of 'parallel' operation, i.e., subscribing to both and recommending new users
join the 'other' list too, a few months ago things kinda came to a head for me, but that's another
story. Since the 'blowup', we are averaging about 500 posts/month, and thanks to Joe being in the
Pacific (?) time zone and me being in the Eastern, we have pretty good coverage of giving permission
to new postersand cleaning up little messes.

I can only think of about a half dozen times that a bogus message with link has gotten past us, and
they are the ones that are posted under an existing members call, WITHOUT THEIR KNOWLEDGE, so
requiring some sort of 'password' doesn't seem too cost/time-effective. In both those instances I
merely locked the file and link upload permissions, which can only be done en masse, for a few days
just as a precaution. The first time no-one noticed, but the secondtime a long-time member was
quite irate (out of proportion I believe) and has since unsubscribed. We have had two instances of a
'drive-by' new member uploading garbage to the files and/or links sections, in which case Idump the
trash ('member' included). I don't know that we have any younger members or others who may be

scarred for life by seeing what was uploaded, but if they're on the internet they've at least had it
flashed in front of them a few times.

So I guess all this says is that unless Joe has been doing a lot of housekeeping before I wake up in
the morning, I think we'll continue to do what we've been doing, successfully, unless something else
happens to change my (or Joe's) mind. If it ain't broke...

Vic -

That's a tough one. There are two VCOs, 0-15 MHz and 15-30 MHz, so your description is that the
lowband VCO locks at power on and stays locked when you go lower in it's range, but if you go above
that the high band VCO does NOT lock, plus once the low band is unlocked it only relocks on power on.

The TR-7 has two 'steering' voltages applied to the VCOs. One is derived from the 24V DC supply and
ranges from 3V for 1.5 MHz and 15V for 14 MHz for the low, and 6V at 21 MHz and 14.5 at 28.5 MHz.
This voltage is used to put the VCO in 'about' the right place to lock, within the capture range of
the actual loop lock voltage. This is allwrapped up inacquisition time, slew rate, loop time
constants, etc., etc., but that's the rough idea of what's supposed to happen.

This is why the 24V supply is critical, because if it's low the entire range is low and the VCOs are
not being put close enough for the loop to acquire lock. However, your 24V supply sounds good, and
the 'idle'(unlocked, free running) VCOfrequencies are 17 and 32 Mhz, VCO alignment is NOT indicated.

Do you have a board extender set available??

Hi Garey

Thank you.

Yes I do have extender boards.

Here is an update on how things stand. This a.m. I put the band switch to 14mhz and then powered up. All OK on that band (locked) went down to 7mhz and still OK so I left it there for a couple of hours and it remained
locked and good sigs. Went back up to 14mhz after 2 hours and all of the bands went into 'unlock'. So I switched off for a few minutes and
set the bandswitch to 7mhz and powered up again - again locked and OK. After a while moved to 14mhz and all bands went into unlock.
Temperature?

During the period I took some more readings on the power board pins. 23.9v was still present on pin 2 but pin 1 only read
-3.7v instead of -5v. I don't know if that low reading would affect the VCO's.

Thinking about pulling the VCO board and measuring what is
reaching that.

Thanks again, Garey

Vic -

OK. Once it it locked on a range it seems to be holding. Again, that indicateseither 'coarse'
steering, -or- perhaps bad presets. This agrees with the locking at turn-on, since the coarse
voltage goes past the necessary spot as it ramps up for the lock to grab it.

Since you have the extender board set, remove the DR-7 and plug in the 'jumper card' from the
extender set. This makes it a TR-7 without digital display or general coverage. Then see if you
can switch bands and/or whether the high or low VCO lockson each band. You can tune in the calibrator on the higher bands so you can tell if it is locked or not. This test will eliminate the
offsets. Do you have a service manual?

Yes, -3.7 is 'normal' for the -5V bus. This voltage is ONLY used to bias off the PIN diodesin the
filter selection board, and anything over a volt or so is good.

Please leave previous messages so we know where we have been. Perhaps one of the TR-7 specialists
will wake up and help!

Hello Keith and thank you for your response.

The serial No of the TR-7 is 1691 and the model No is 1337. The PSU serial No is 1883.

Where does this place the combo in relation to date and spec?

On Mar 8, 2013, at 9:23 AM, Garey Barrell <k4oah@...> wrote:

OK.... It's kinda funny that the only 'complaints' or 'suggestions' about how the list is run
surfaced after ONE member complained he was unable to upload a file! :-)

We must be quite fortunate in operation of the list, because I certainly don't know anything about
running one, and no offense, but I don't think Joe is far ahead of me. We were asked to take over
the list when the originator lost interest and didn't want it to die. The 'other' list is the
opposite of over-moderated, e.g., 'the list isn't working', answer: (if any) 'so? can't help you'.
So I thought it was worth saving and running in parallel, and apparently so did Joe.

This was four or five? years ago, and it's been running pretty good. We are fortunate to have ~975
adults (sorry Jim!) who know how to use a delete key when something offends their sensibilities,
ratherthan complain _to the list_ about my failings.

After several years of 'parallel' operation, i.e., subscribing to both and recommending new users
join the 'other' list too, a few months ago things kinda came to a head for me, but that's another
story. Since the 'blowup', we are averaging about 500 posts/month, and thanks to Joe being in the
Pacific (?) time zone and me being in the Eastern, we have pretty good coverage of giving permission
to new postersand cleaning up little messes.

I can only think of about a half dozen times that a bogus message with link has gotten past us, and
they are the ones that are posted under an existing members call, WITHOUT THEIR KNOWLEDGE, so
requiring some sort of 'password' doesn't seem too cost/time-effective. In both those instances I
merely locked the file and link upload permissions, which can only be done en masse, for a

few days
just as a precaution. The first time no-one noticed, but the secondtime a long-time member was
quite irate (out of proportion I believe) and has since unsubscribed. We have had two instances of a
'drive-by' new member uploading garbage to the files and/or links sections, in which case Idump the
trash ('member' included). I don't know that we have any younger members or others who may be
scarred for life by seeing what was uploaded, but if they're on the internet they've at least had it
flashed in front of them a few times.

So I guess all this says is that unless Joe has been doing a lot of housekeeping before I wake up in
the morning, I think we'll continue to do what we've been doing, successfully, unless something else
happens to change my (or Joe's) mind. If it ain't broke...

Hi Dave,
I have no idea of what your model NO 1337 is all about.
You can go to _www.w4bfn.com_ (http://www.w4bfn.com) and the Drake spot for what is a fantastic amount of Drake information including a serial number vs build date index.
Perchance your units still have the cardboard wired tag on them it will give the serial number and build date.
Another party has already advise that you have early units and I agree.

Hi Carl
The model number is the number Drake gave the TR7, I guess for their catalog.
I think this started with the 7 line as I don't think I have any for the 4 line gear.
I guess others on here will no doubt be able to refine my answer.

went thru the t4x ,all the usual contact cleaning,pot cleaning,checked tubes etc. Put the rig on dummy load and went to set the bias,per the manual. When I go to tune, the ac-4 makes a little differant sound , the meter shows no bias indication at all and with in about 10 seconds the pilot lights turn off. turn the switch back to SSB and in a few seconds the pilot lights come back on . I checked the ac-4 ,all voltages are correct including the bias voltages. any ideas where to start? never saw any smoke ,at least not yet.

Weird... I could understand if there was a short between the PA Cathodes and R36 (shorted C60?) but
that would blow the 'correct' fuse in the AC-4, not turn off the lights! and the short would be
present whether the MODE switch was in SSB or TUNE. The lights are just in series across the
filament line, but if that were shorting it would blow the 8A fuse under the chassis. It wouldn't
'come back on'.

Check the wiring for the lights, they are prone to swivel around and perhaps short to the chassis.
If nothing there, I'd pull the PA tubes and see what happens. Monitor the filament line when you
switch from SSB to TUNE.

From: Paul Kraemer
Topic: 12381 Message: 12449

AC-4 Upgrade Kits

Shipping costs:

After evaluating several options USPS and FedEx Home Delivery the USPS is still lowest cost for small lightweight packages even after insurance is added.

The USPS insured parcel post shipping adders within the 48 states are:

One kit $8

Two or three kits $12

Four or more kits $15

Out of country, please ask giving specific destination details.

In addition to your physical address it is always a good idea to include a phone number. If I use FedEx it is required I have a phone contact for the recipient.

How to pay:

I will email an invoice to you

Please make payment to Paul Kraemer or Electronic Specialties. The government doesn't care which way I do my accounting---so long as I do it.

Speaking of government, Iowa customers please add 7% for the IA sales tax.

Payment may be in form of Check, money order, or PayPal. For PayPal please add 3% of the total invoice amount to cover their fees. My PayPal is same as my email elespe@...

My mailing address:

Paul Kraemer

207 N. Morgan St

Fairfield, IA 52556

Shipment will be made after payment is received and verified.

At this time we are on schedule to begin shipping March 25, 2013

I want to personally thank you for favoring us with your purchase. We strive to make every customer a happy customer

Paul Kraemer K0UYA

Electronic Specialties

Thaaattt's better. :-)

Simple fact.... "It takes two wires to ring a doorbell!" This is a statement I heard MANY years
ago from along gone old timer. Essentially it means you have to have a 'complete' circuit for
something to happen.

So IF we have Plate voltage on the PA tube plate caps, and Screen voltage on the screen pins and
ground the Cathode, current WILL flow, regardless of anything else in the transmitter. Make that
LOTS of current. Now if we apply a negative voltage to the Grid, we can control that current flow,
regardless of anything else.

Quick check, if the T-4X has been modified for use with the TC-2/6 transmitting converters, it will
have three additional RCA jacks on the back panel. One taps off a bit of RF on 14 MHz. The other
two are used to interrupt Screen voltage between the power socket and the feedthrough cap on the
underchassis PA shield wall. This calls for a jumper cable between those two jacks, or some sort of
shorting link across them inside the chassis,

No TC jacks? Check the voltages ON the PA tube pins. If the Cathode reads 130+ or so, they ain't
grounded. The ground path is through R32, 33, then through RFC2, C60 to R36, then to a relay contact
that should ground this point when the relay is closed. The Cathode voltages should go to a fraction
of a volt, and idle current will flow.

12453. R4-A for Restoration

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-08 22:34:36 UTC
From: daveincaol
Topic: 12453 Message: 12453

I've uploaded several photos of the R4-A I want to refurbish. The upper copper plate is the main problem and because I don't want to dismantle too far perhaps the best thing I can do is copy K9SUL's approach and clean and copper paint the corroded surfaces, then follow up with waterslide transfers to replace the labelling.
I could grit blast the outer covers and repaint with 'authentic' enamel. I've been promising myself I will build a Grit blast cabinet 'one of these days' - this could be the time.
Comments and observations much appreciated.

Garey
No extra jacks on this rig. measured the voltages on the 2 finals first with the switch in SSB. second with the switch in TUNE.

both tubes in SSB. both tubes in tune

pin 1-274 267
pin 2-77 0
pin 3-148 0
pin 4-0 0
pin 5-0 0
pin 6-77 77
pin 7-273 266
pin 8-0 0
pin 9-148 0

any ideas, I need to get a readable schematic, mine is too hard to read.

thanks
dale wt4t

Dave -

Unless you're wanting to restore a family heirloom or otherwise bring back a radio that's personally important to you, I'd hold off.

With the great international communication that we have nowadays, we should be able to get you what you want for a fair price - the only sticking point being the shipping charges. The copper plating on all the pre-C rigs can only be restored a certain amount. You really must find an example with no corrosion, or, at least, very little corrosion.

They're out there. One must be patient.

Subject: [DrakeRadio] R4-A for Restoration

I've uploaded several photos of the R4-A I want to refurbish. The upper copper plate is the main problem and because I don't want to dismantle too far perhaps the best thing I can do is copy K9SUL's approach and clean and copper paint the corroded surfaces, then follow up with waterslide transfers to replace the labelling.
I could grit blast the outer covers and repaint with 'authentic' enamel. I've been promising myself I will build a Grit blast cabinet 'one of these days' - this could be the time.
Comments and observations much appreciated.

Dale -

If you had my CDs you'd have all the schematic versions, clear andeasy to read. Also where to find
all those peskyparts. Take it to your local FedEx Office and print it out 2' x 3' if you like. See
attached.

The Pin 9s are where the two 15 ohm Cathode resistors come together, then through the RFC2 to C20
and out. The Cathode voltage is going to 0, so the stage IS keyed and current is flowing, except
the BIAS voltage is too high. Bring it down into the -60V range while watching the PLATE meter. You
should hear the AC-4 groan a little, and if still no current showing on the meter, then the meter is
being shorted out.

Pins 2 and 6 are all grid pins are all tied together with the brass strap and should be NEGATIVE 65
V or so. You show one going to 0 volts in TUNE, transcription error or bad solder or..... All four
pins should stay the same voltage.

I understand, when the ac-4 goes, you're better off replacing it with a new replacement kit. I did, it wasn't much
money and it's relatively easy to do if you're at all handy.

What a GREAT start on new nicknames! There's "Jim," "Another Jim," maybe "The Other Jim," or "Some Other Jim." How many Jim's do we have, anyway? Is there a "Slim Jim?" A "Diamond Jim?" The possibilities are endless!

Then there's the "Good Jim," and the "Bad Jim," giving the different Jims the ability to claim, "No, I'M the Good Jim," no matter how many Jims we have... they can ALL claim it!!

All you Jims, log in now and stake your claim to a name!

12467. RV-4 problems

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-09 18:16:38 UTC
From: Mark Pilant
Topic: 12467 Message: 12467

While I'm waiting to set up a local sched with (I hope) fixed TR-4
I thought I'd tackle an RV-4 (S/N 17670) I just picked up.

The RV-4 is in reasonable shape, but (of course :-) doesn't work
when I connect it up to my TR-4.

Doing some poking around, I disconnected to power lead to the VFO
and applied power from a separate power supply. (The RV-4 was
connected to the TR-4 but it was turned off.) I hooked the VFO
output to my scope and a counter, and the frequency range goes
from 4.89 MHz to 5.51 MHz with a nice clean sine wave output.

So far, so good.

However, when the VFO is connected back into the circuit and the
TR-4 is powered up, there is no voltage to the VFO. Voltage to
the base of Q3 is just about 4.5 VDC, which is a little high but
less than 10% high. (When the switch is in RCV or RCV/XMIT.)

I did use contact cleaner on the switch and the tube pins, but
that didn't affect anything.

I'm thinking Q3 might be toast, but I thought I'd pass this by the
knowledgeable folks on this list to see if I'm thinking right :-P

A couple if things I did notice is this RV-4 doesn't seem to have
the NE-2 neon light anywhere, and there don't appear to be any
provisions for FSK. SO I'm thinking this is a pretty early unit.

So many projects, so little time :-)

73

Mark -

Simple. Q3 is toast! Base voltage should never be higher than about 0.7 VDC. If you clip the
Collector lead of Q3, the PTO should have ~11VDCand be operational. A 2N3904 is a reasonable substitute.

Thereseem to be several RV-4 iterations. The earliest had an 0A2 VR tube and no Q3, also no panel
indicator. I believe there was anRV-4"B" to go with the TR-4"B" when both had the neon indicators
behind the MAIN TUNING fiducial like the B twins. There was no identification as such but this group
started at about s/n 27k and had the "B" ergonomic changes as well.

FSK is enabled by the terminal on the side of the PTO just behind the gearbox. It requires anexternal cap and diode switch for true FSK. Very few use FSK any more, just about all AFSK SSB.
Best accomplished by the CAR OSC shift as used in the T-4XC.

Frank -

Posting your need to the list is probably the best thing you can do. There are donor units around.

What is the problem with your unit?

Power switch? Most common, easiest to wire across it and control power with an external power strip.

Either of the potentiometer sections? Try a shot of CAIG FaderLube spray. This stuff works wonders
with pots that are just dirty, not damaged. If no luck, Drake used very common RTS pots, so it's
possible with care to swap out resistance elements or even wiper mechanics from donor pots.

These dual pots with switch are the bane of vintage gear, they just ain't making them any more. I
run all vintage gear from switchable power strips and control individual unit power with the
external switch OFF.

Hi Garey.

The thick plottens...

It turns out Q3 is fine. I tried a replacement (NTE 85, same base)
with no improvement. So I put both on my curve tracer (Tek 7CT1N)
and had the same curve traces, and looked fine.

Going back and measuring the (DC) voltages on Q3 I get:
B E C Switch
0.64 0 0.024 Off
0.51 0 0.008 RCV
0.51 0 0.008 RCV/XMIT
0.64 0 0.024 XMIT

Looking at the V1 plate connection (pins 1 & 6) I measure
240V
207V
207V
240V

for the same switch positions.

I did fine the neon light; it lights up the (12 oclock) dial indicator.
It lights up only in the RCV and RCV/XMIT positions as expected.

I'm not sure where I came up with 4.5V for Q3 in my last posting. That
is the voltage on V1 pins 3 & 8 in the RCV and RCV/XMIT switch positions.

All the wiring looks to be original. The only difference is in the
colors of the wires in the cable which plugs into the TR-4. But I took
off the cover of the plug to see which colored wires went to which pins.

Off to stare at the schematic (and scratch my head) some more...

Hi Garey.

A little more information.

Looking at your CD, it appears the RV-4 I have corresponds to the schematic in the "RV-4C Manual". The colors match on the cable, and L3 is adjustable like my RV-3.

OK. Well with the Emitter grounded you can't read more than about 0.7V or the transistor is blown.

Now.... If you just lift the Collector lead of Q3, you should read 11V on the PTO power lead. If
still near 0V, then the internalZener diode is shorted.

The problem of the potentiometer, is as follows:
A part of Stick it carbon (part Audio) is consumed, is interrupted.

I would like to replace the audio portion of potenziometer, which today is the potentiometer (make and model) where to get the part to replace, (size and characteristics)

Hi Garey
Pulled DR7 and fitted jumper board and a little bit of progress. I can hear the calib on all bands 14mhz and below but not on
21mhz upwards. BUT when I switch to 14 again I hear the calib. Now this is different because before if I switched to 21 it knocked all the
bands out of lock and now it doesn't do that.
Don't know if that helps.

Cheers
Vic - from a very cold UK

Vic -

OK. Once it it
locked on a range it seems to be holding. Again, that indicateseither 'coarse' steering, -or- perhaps bad presets. This agrees with the
locking at turn-on, since the coarse
voltage goes past the necessary spot as it ramps up for the lock to grab it.

Since you have the
extender board set, remove the DR-7 and plug in the 'jumper card' from the
extender set. This makes it a TR-7 without digital display or
general coverage. Then see if you
can switch bands and/or whether the high or low VCO lockson each band. You can tune in the calibrator
on the higher bands so you can tell if it is locked or not. This test will eliminate the offsets. Do you have a service manual?

Yes, -3.7
is 'normal' for the -5V bus. This voltage is ONLY used to bias off the PIN diodesin the filter selection board, and anything over a volt
or so is good.

Please leave previous messages so we know where we have been. Perhaps one of the TR-7 specialists
will wake up and help!

Frank -

I think your best bet is to post a 'wanted' to this list and perhaps to the 'Drakelist' at <http://drakelist@.../drakelist/listjoin.html>as well. A control from any TR-3/TR-4/C would work.

Analternative would be a single 500k audio pot with switch, which is very common, and just wire the
RF GAIN with a 10k resistor to emulate full CW rotation. The control is rarely used in most cases.

I'll have to give this a try, and see what turns up. I have to be a bit careful because I noticed with just the little but of work I did to replace the transistor, the traces/pads are starting to lift from the PCB. (BTW, I'm using a Weller temperature controlled soldering iron.)

I don't think the internal Zener is shorted because when I apply DC voltage to the PTO it works fine. (I used a current limited supply set at about 14 VDC to supply the PTO.)

I'm beginning to think it may be the switch itself, because it does really seem to be a problem in the switching circuitry (since the PTO work outside that environment).

Mark -

I missed that earlier.... Which is why I like to leave previous messagesinplace.

Obviously you are correct, the Zener can NOT be shorted. When the BASE voltage drops to about 0.5
V, the Collector should go to 11 V, allowing the PTO to run.

Pin 1 is +250 VDC, R15 and R17??

12481. r4b audio problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-10 19:33:43 UTC
From: dalepavlicek
Topic: 12481 Message: 12481

I started to work on the r4b I just bought,cleaned it up contacts,switches pots etc. the seller said it was a real performer...YAH... any way, the rig does perform OK,somewhat, but the biggest thing I hear is bad audio, very narrow band and scratchy and seems much touchier to tune in a solid SSB signal than my old r4a. I checked around V7, all the resistances were within range except pin 6 read 4.6 instead of 15k. did a voltage check also .again everything checked very close ,pin 1 had 3.9 volt,book said should be 4.5. I did not have another 6eh5 to sub. Maybe Iam going in the wrong direction, for this problem. The sensitivity does seem down compared to my r4a. no amount of playing with the tuning, passband ,notch or filter setting effects the crummy audio.
I guess its time to say Help.
thanks
dale wt4t

Garey
Iam not getting any reading on the 3 legs of Q7, maybe Iam doing something wrong?? or checking the wrong thing.
dale

Dale -

Voltage ok on Pin 6? Check value of R44, condition of C176. Cathode voltage low says tube not
drawing expected current.

Voltage on C173? DC voltages on Q7?

> I started to work on the r4b I just bought,cleaned it up contacts,switches pots etc. the seller said it was a real performer...YAH... any way, the rig does perform OK,somewhat, but the biggest thing I hear is bad audio, very narrow band and scratchy and seems much touchier to tune in a solid SSB signal than my old r4a. I checked around V7, all the resistances were within range except pin 6 read 4.6 instead of 15k. did a voltage check also .again everything checked very close ,pin 1 had 3.9 volt,book said should be 4.5. I did not have another 6eh5 to sub. Maybe Iam going in the wrong direction, for this problem. The sensitivity does seem down compared to my r4a. no amount of playing with the tuning, passband ,notch or filter setting effects the crummy audio.

Well if those readings are accurate, you've found your problem.

You should have ~12 on C173. Q5, 6 and7 are all suspect, along with switch S2(rear).

See attached.

12486. TR-4Cw Alignment

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-11 15:50:28 UTC
From: slowcountry1
Topic: 12486 Message: 12486

Restarting my interest in Ham radio and putting my TR-4Cw back into service; I have replaced and or repaired all of the miscellaneous items, for the exception of the VOX circuit, and now have a wonderful rig again. (Still trying to sort out the VOX issues) I truly appreciate everyone's gracious assistance.

Since I have made the repairs and I plan on maintaining my Drakes for years to come, I figure that I should learn how to align the unit myself. The alignment procedures in the manual appears to leave some questions for those of us that grew up in the semi-conductor age and have not aligned a tube type rig. A couple of the steps appear ambiguous to me. The manual calls for alignment with a VTVM. I do not have a VTVM, but a Fluke 289 and other digital volt meters. Reading on the subject and talking to a local ham indicates that DMMs are not the way to go when attempting an alignment.

I would like to find out if there is a method that will employ a DMM to facilitate a proper alignment or what type of meter that I should procure for this venture. If all else fails, I have a local ham that is extremely knowledgeable and capable of aligning the rig however; as stated previously, I would like to attempt this task.

Again thanks for all the help!!!

12487. Re: [DrakeRadio] TR-4Cw Alignment

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-11 16:38:36 UTC
From: Barry
Topic: 12486 Message: 12487

The primary reason to use a VTVM is it presents a very high impedance to the circuit under test. It is probably one of the very reasons they were invented. Low impedance measurements will yield very different readings and can cause the circuit to stop working completely.

While you might be able to replicate, somewhat, the high impedance measurement with your DVM (using a probe with an appropriate high value resistor, etc.), there is nothing quite like using a nice analog meter when tuning for peaks and/or nulls. Even with bar-style readouts, etc., it is something that a DVM just lacks.

Good luck with it. I would think there would be more test equipment you'd need (signal generator(s), scope, etc.) but a good VTVM is hard to beat when it comes to alignment time.

Thanks,
Barry - N4BUQ

12488. need manual for early version of TR-6

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-11 17:00:22 UTC
From: turbo_plumber
Topic: 12488 Message: 12488

does anyone have a manual and schematic for the early series TR-6 that has the 2 trimmer caps on top of the chassis and no T-17 I think it is.

what do the trimmers do , mine only puts out about 95 watts with new finals (I dont have a new driver tube (6GK6) yet but swapping the two in the radio made it loose 15 more watts output. Hopefully a new driver tube will get it up to 150 or 160 watts out like Im guessing it should be able to do

Thanks
Doug

Garey,

I am working on a T-4XC and, among other components, will be replacing the final cathode resistors, R53 and R54, and screen resistors, R50 and R51. In the past I used CC replacements from my stock but this time I plan on using the Ohmite OX/OY ceramics.

Below you mentioned that Drake tightened the spec to 5% (from 10%). Unless I missed it, the OX and OY series seem to be available in 10% only. Do you have a link and/or part number to 5% devices?

Thanks,

Ken

Ken,

The OX an OY series come in 10% tolerance there is not a 5% tolerance in this line, so far as I could tell.

What I did was purchase 12 each of the values required and ohm'd each one until I found 3 of each that were close in value and close to the value required. There was definitely 10% variation.

For the 15 ohm 2 watt resistors I was able to find 15.23, 15.07, and 15.18. For the 68 ohm 1 watt I was able to find 67.84, 67.73 and 68.41. I figured I'd purchase extras because I have two other radios that I am going to do however; the values are far from what I wanted therefore I picked the closest matches for this exchange. Someone may have a more logical approach however; this is how I got what I needed.

Doug,

I don't know the version differences of the TR-6 early or late, however I have the manual that was supplied with my TR-6. The rig's serial number is 409. If this would help, I could try to scan the schematic and send it.

Ken -

Well I buy 10 at a time, and usually find five pairs. Like most modern components, they're much
tighter than specified most of thetime. I pick a pair that are within 10% of 15 ohms, and within 5%
or less of each other. They directly affect the 'match' between the finals, so the closer the
better. There's nothing wrong with the carbon comps, as long as they are in spec. You can get 2W
units in there, so that's better still. They are making carbon comp resistors again, but all I can
find are 1/4 or 1/2W types.

The 68 ohm resistors are not nearly as critical. They are merely decoupling the screen voltage and
have no real effect on PA current. Most any modern resistor is fine here.

12495. TR-7 puzzlement

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-11 20:22:00 UTC
From: Gary Woods
Topic: 12495 Message: 12495

Well, I'm finally getting back into my TR-7 that died months (perhaps 12 or more) ago.... the blown fuse was caused by a shorted 10-Volt pass regulator that was murdered by a dead short on the +10 buss. Fairly quickly narrowed it to the translator board, BUT: there's no short when the board is on extenders, no visible marks where things might have been touching the chassis. I even put a strip of masking tape between a shield cover and the connector where the +10 arrives. No joy. Next will be to solder-suck a couple of reachable components and perhaps +10 the pin on the socket that plugs onto the motherboard.
Any interesting war stories? Can't even use my lo-ohm shortsqueek finder down in the shielded compartment.

Garey my radio is ser#036 can I get a copy of that from you somehow? I have what I guess is a later model manual and schematic and it shows T17 which my radio does not have. Im sure some of it applies but it woul;d be nice to have the right one, especially alignment info

thanks
Doug

I had a case one time where a component on a PCB had been bent just a little too close to the female Molex connector. The male pin from the parent board would portrude through the body of the female connector just enough to make contact with the component when the board was fully seated. Pull the board up just slightly, and all was well. Once I figured it out, I simply re-formed the offending component to not be so close.

>
> Today, I bridged the C145C with a 45uf cap instead of a 10uf cap and that produced no results. I looked everything over and I'm not finding a culprit. For smiles and grins, I removed R106 from the circuit however; it did hold the relay in a little bit longer but not much. It actually measured 3.7K instead of 3.3K. I soldered it back in. For some reason, to which I cannot explain, the VOX will now work with normal voice however; the VOX gain has to be turned all the way CW. Any movement off full CW and it will not work.
>
> Doug
>

Ok, I found the VOX issue. It was the VOX potentiometer the entire time. When I first started chasing down the problem, I ohm'd one leg to the other and had about 485 KOHM and checked the wiper to each leg, while turning the POT; it changed in value as expected and did not show issue. I was very frustrated today and ripped the pot back out and remeasured. The POT was open between the two legs, I opened it up and all the resistive trace came out on the bench. I then went to my parts rig and pulled bothe the VOX and side tone pot and found them to both be defective. I pulled the side tone pot out of my good rig and installed it in place of the VOX pot. I took the 200KOHM antiVOX pot out of the donor unit and placed it in the side tone position on the good rig until I can find a working replacement.

Does anyone know where to locate the 500k pot for the VOX control? I'm assuming this to be an obsolete part?

Thanks to the group.

Hi Garey.

> Which is why I like to leave previous messagesinplace.

Yep. I understand. I try to trim the message to which I'm responding so the points made are left intact.

Previous messages work as long as there aren't lots and lots of them. It is difficult to follow a message which includes 5-10 replies to the original post. Especially on something with limited screen real estate (like a smart phone). I make use of (my own and Yahoo's) message archives to refresh my memory about a topic.

Anyway, the problem has been solved and I'll do another post with all the details.

12501. My TR-7 changes frequency without my help.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-12 01:23:53 UTC
From: Carl Maniscalco
Topic: 12501 Message: 12501

Hello, all—

My TR-7 recently developed a glitch: It works properly when I first turn it on but after about ten minutes, the tuned frequency will drop exactly 500 kHz. Once this has happened, pressing either the "UP" or "DOWN" keys, changes the frequency in 1 MHz increments rather than the normal 500 kHz step, although the LED display will flash the 500 kHz increment for a fraction of a second on the way past. A quick off-on power cycle doesn't eliminate the problem; letting it sit overnight does, which leads me to believe it's a thermal issue. I have not yet had the opportunity to test how long it needs to be powered down before it returns to normal operation.

Any ideas on why this is happening and how I might go about fixing it?

73,

Carl Maniscalco, KJ6BSO

12502. Re: [DrakeRadio] RV-4 problems... solution found

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-12 01:23:50 UTC
From: Mark Pilant
Topic: 12467 Message: 12502

To recap...

I picked up an RV-4 which was pretty reasonable from a cosmetic standpoint, but had no output when switched to RCV or RCV/XMIT. The neon "activity" indicator would illuminate as did the dial back light.

Now on to diagnosis...

The first thing I did was to use contact cleaner on the switch as well as the tube socket. After that, I pulled the RV-4 from the cabinet and connected it to my (work in progress) TR-4 and fired it up. No output, as the seller indicated.

Checking the PTO supply voltage on Q3's collector showed only about .5 - .6 VDC regardless of the position of the RV-4 switch.

So, I pulled the PTO supply lead from the small PC board and applied about 14 VDC from a current limited supply. Using my 'scope to monitor the PTO output I was rewarded with a nice looking sine wave. Hooking up my frequency counter instead of the 'scope indicated a frequency range from 4.89 - 5.51 MHz.

I was very pleased to find out the PTO was working fine.

Given there was only limited voltage on Q3's collector, I made the decision to replace it; think it was shorted. However with a new (NTE-85) replacement in place, nothing changed.

So next, I put the original 2N3394 and the NTE-85 in my curve tracer to see if they were OK. After setting up the controls appropriately, I was rewarded with a set of fine looking curves for both transistors.

Next, I measured the supply side voltages for both R15 and R17. They looked to be appropriate. About 245 VDC for R17 and 210 or 245 VDC for R15 depending on the switch setting. The higher for OFF and XMIT positions and the lower for the RCV and RCV/XMIT positions.

After this, I followed Garey's suggestion and took the collector of Q3 out of the picture. What I did was to lift the Q3 side of R15 and the PTO V+ lead from the small PCB and connect them together with a clip lead. When I measured the PTO supply voltage it was 0.

So after just a bit of head scratching, I decided to measure the resistance of R15. It was OPEN!!!!.

Finding a suitable replacement and hooking everything back
together with clip leads I ran the RV-4 through the switch positions
and everything worked!!!! Time for the "Happy Dance" :-)

The only problem I need to resolve at the moment is to find an
appropriate replacement for R15 which will fit in the space. The
one I have clip leaded into position is a 10w resistor, and it is
too long to fit into place. Oh yes, I'll need to do an alignment
as well.

Through all this I did learn an important lesson.

One needs to be careful with the PCB. Even with a temperature
controlled soldering iron I was starting to have problems with the
traces lifting due to the heat.

Garey, thank you for your continuing help and support for all
things Drake :-) :-)

So that's it... for the archives.

I found a shorted cap on the 10 volt line going into the first mixer board. When I first looked at it, I didn't realize that the odd looking brownish black capacitor was odd looking because it was burned up! The cap in question was one of those multicolored plastic tantalum caps. These caps were used in a lot of places to decouple the voltage lines into the sub assemblies. Luckily, I had another mixer board and once I realized the part was fried, I swapped in the other board and have been fine ever since. As always, your mileage....

In a message dated 3/11/2013 4:22:16 P.M. Eastern Daylight Time, garygarlic@... writes:

Well, I'm finally getting back into my TR-7 that died months (perhaps 12 or more) ago.... the blown fuse was caused by a shorted 10-Volt pass regulator that was murdered by a dead short on the +10 buss. Fairly quickly narrowed it to the translator board, BUT: there's no short when the board is on extenders, no visible marks where things might have been touching the chassis. I even put a strip of masking tape between a shield cover and the connector where the +10 arrives. No joy. Next will be to solder-suck a couple of reachable components and perhaps +10 the pin on the socket that plugs onto the motherboard.
Any interesting war stories? Can't even use my lo-ohm shortsqueek finder down in the shielded compartment.

My TR7 did this to me a month ago - like many others here I found that cleaning the pins and sockets on the cards located under the DR7 board fixed the problem. You'll need lots of patience to get the DR7 out, take off the cover over the cards that are under it and remove each card one at a time. Spray the Molex pins with De-Oxit, wipe clean, spray a tiny bit of De-Oxit into the socket the board mounts to, give it some time to evaporate, and then reinstall the card. I did the whole procedure over several nights but I am really slow.

Hello, all—

My TR-7 recently developed a glitch: It works properly when I first turn it on but after about ten minutes, the tuned frequency will drop exactly 500 kHz. Once this has happened, pressing either the "UP" or "DOWN" keys, changes the frequency in 1 MHz increments rather than the normal 500 kHz step, although the LED display will flash the 500 kHz increment for a fraction of a second on the way past. A quick off-on power cycle doesn't eliminate the problem; letting it sit overnight does, which leads me to believe it's a thermal issue. I have not yet had the opportunity to test how long it needs to be powered down before it returns to normal operation.

Any ideas on why this is happening and how I might go about fixing it?

Steve,

I would make one adjustment to your excellent procedure below. I would NEVER spray DeOxit anywhere around a circuit board. DeOxit is conductive, and if sprayed (or oversprayed) on a PC board it may well do more harm than good in the long run. I like the "needle applicator" bottles, or spray what you have in the cap on the can and use a toothpick to put very small amounts of DeOxit on pins and sockets.

I had to learn the hard way to "first do no harm" in my repairs, hi.

My opinion, don't spray DeOxit (or any other cleaner) ANYWHERE. It should be used sparingly, and only where needed. A spray will always go everywhere you don't want or need it. The only exceptions would be cleaners that evaporate competely, leaving no residue.

I have a T4XC serial number 24049, and a 2nd T4XC serial number 23408. Are the PTO's interchangeable without any alignment or power issues? The reason I ask is unit 23408 seems to have what feels like a flat ball bearing on the main shaft. While turning the main knob there is a knock or bump coming from the ball bearing area on the main shaft. I have clean the whole unit and can't see any debris or damaged bearings so I'm ready to swap out the PTO with my working spare unit if possible.

Maybe there's a nick or burr on the shaft as opposed to a flat ball?
Odds are you will have to do some minor alignment for the dial reading to be accurate if you swap them- there's a chance you might get lucky and they're almost exactly the same, but I would assume not and possibly be pleasantly surprised.
These rigs are pretty simple to align especially if you have an accurate frequency counter and/or sig gen, however if you really don't want to touch it maybe some more prodding is in order with the mechanics of your issue.
Otherwise, your spare PTO should be plug, er uh, solder and play.

I have found PTO's in the B-Line and earlier to be drop-in compatible. Since the C's are the same circuit with a different geartrain, I'll assume that this is true for them as well. If the dial needs adjustment, it is done simply by lifting the gear that's under spring tension up and moving the dial scale[s].

I don't have a TR-4, but I really appreciated reading VA3MGN's recent file upload. If you haven't checked it out, take a quick look. There is experience shared in it that would be useful for any Drake owner, regardless of the model. Here's the title, found on the YahooGroup website: Upgrades, Troubleshooting and Alignment of TR-4 S/N 26104

By Matt Newman, VA3MGN/AA1VN

Thanks, Matt - great writing! You did a good job communicating the repair history of your TR-4.

Topic: 12510 Message: 12514

Dave -

The short answer is 'Yes'. I have documented at least 17 varieties of the 4 Line PTO, some due to
semiconductor (BJT or FET) and most due to iterations of the supply line decoupling. The basic
circuit though, is the same from the R-4A (the R-4 was a tube version) through the TR-7. The
TR-4CwRIT was the first to add RIT, using what had previously been the FSK terminal on the side just
behind the gearbox, through the TR-7. The only difference I am aware of was that they would select
the highest output PTOs and reserve them for the RV-4/Cs.

The mechanical differences for the A/B, C, and 7 are all different of course. Some have tried to
replace JUST the PC board and coil assembly, with varying degrees of success. I know of only a
couple of cases where the new assembly met the original linearity specifications. Aside from that,
the circuit seems to be relatively insensitive to component changes, other than the TC and padder
caps, marked with asterisks in the schematic. Thereis also some sensitivityto lead placement of the
internal wiring, but less than I expected.

All in all, pretty amazing performance from a utilitarian design.

As for your mechanical problem, I'd suspect a lump of hardened grease in the front ball bearing,
perhaps adhered to the wall of the bearing race. I don't believethat the shaft of the lead screw or
one of the balls could be damaged once assembled. This assembly is easily repairedby loosening the
set screw at the back end of the lead screw until the front bearings fall out. There are 10 steel
balls, 0.125"dia (ACE or True Value hardware stores), and a single one at the back end under the set
screw. Rather than swap, I'd recommend just repairing the existing PTO and returning it.

Hi Guys
Thanks for the info I figured they were compatible just wanted to make sure. I didn't know the B-line would work these are much nicer running gear trains. I find my b-line to be super smooth, and positive feeling, my C-line doesn't have the same feel.I don't think I would swap a B PTO into a C though I like the twin dials on the C-line.

12516. Upgrades, Troubleshooting and Alignment of TR-4 26104

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-12 20:50:08 UTC
From: matt.newman10
Topic: 12516 Message: 12516

I want to thank Garey, K4OAH, for his ongoing encouragement and mentoring during the upgrading and alignment of TR-4 26104. With his help, and the help of the Group, my TR-4 is now in excellent working condition. I can now troubleshoot most problems with greater confidence.

I am the third owner of TR-4 26104 (version 3 of 8) produced in early 1967. Upgrades made by the first owner and myself moved the circuit into the 27000+ series. Also installed is a late version solid state AF preamp board consistent with 28500.

I first had a problem peaking RF TUNE on any band other than 40M. By following proper alignment procedure and, with the aid of the Drake Service Supplement CD, I not only solved the problem, but in the end achieved top overall RX/TX performance.

My report, "Upgrades, Troubleshooting and Alignment of TR-4 26104" has been uploaded to Files. It has been a great learning experience. Comments and criticisms are always welcome.

73,

Matt, VA3MGN/AA1VN

12517. enhanced AC4 cooling case

Yahoo group: DrakeRadio (2013-01 — 2013-06)

From: qrper
Topic: 12517 Message: 12517

boys and girls

I mentioned this in an another message about a custom cover for the Drake AC4.

I received two quotes from metal fabricators..

The case top will/might be made of .050 alumimun with a custom silk screen appled to one side.

it will be a drop in replacement with a 60mm fan to draw out hot air from the cabinet.

So my question to the group; is there enough interest to move a head with this project?

Here's the prices and subject to change

just the new cover without hardware or fans is $14.95
New cover with fans, fingerguard, and all new hardware is $24.95

Now i'm going to guess that most of you are saying out loud, "Cricky, that a lot for a piece of metal!"

and you're be right!

Quite frankly, I had figured a couple three buck for the piece. I was wrong.

That's why I'm posting this here. If I get the feeling from your feedback that it's too much, then I'll drop the idea.

on a side note, I've been working with the people that used to work for drake and have purchased the metal working machines. So, in a way the new cover would be made by drake.

so, there you have it. Pop me a note. Let me what you're thinking is on this. The project is not going to be a money maker, I'm doing this just because I like the old black radios.

12519. R-4C: LSB heard at 14.008

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-12 22:24:49 UTC
From: Charles Ring
Topic: 12513 Message: 12519

Yesterday, I heard LSB voice on 14.008 and about 14.012 with my R-4C with all settings appropriate for that frequency. I also heard normal CW signals so the radio was working right. The voice signals were too weak for me to catch callsigns (I did hear them being given) but it sounded like normal USA ham conversations. What sort of image was I hearing?

Terry and all

I am not taking orders. I am just slipping a toe into the water.

I'll need to scare up a couple of grand to meet the initial run of 100 pcs.

I'd there is not enough interest, then I'll leave it die a slow agonizing death.

I thought of going to china, but damn I'd hate to do that.

I forgot to mention the fan will have some sort of electronics to operate them from the filament string.

12522. ElectroVoice 630 and TR-4C

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-12 23:11:09 UTC
From: slowcountry1
Topic: 12522 Message: 12522

While cleaning up my shack, I found an ElectroVoice 630 microphone that I acquired in a group of items from an estate sale. I am currently using an un-amplified D-104 with my TR-4Cw. The Electrovoice would be a nice exchange as it has a flexible stand and a foot switch.

I changed the pins for Hi-z and wired the unit to the mic plug. I am unable to get any audio out of the mic. I believe the mic element to be bad but want to make sure this is the case prior to throwing it aside. I disconnected the mic element wires from the on and off switch and ohm'd the element and it shows open. I switched the DMM to millivolts and whistled into the mic and did not produce a millivolt reading. Can someone verify for me that the element is dead?

Thanks,

Doug

Mike,
I'd be interested in 4 of the covers.

12525. RE: [DrakeRadio] enhanced AC4 cooling case

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-12 23:57:48 UTC
From: Terrell Hamilton
Topic: 12517 Message: 12525

Heck, Mike, the darn thing only costs $25.00 for the deluxe edition, it seems like everyone with an AC4 would want one for however many AC4's they've got. A couple of years back, someone got a lot of interest in replica Drake LogBooks, and had a bunch published. I got 10, I think, so there's history of group buying here.

Don't go to China, I like the idea of using the old Drake fabricators...

I can't help you with your question, Doug, but I am interested in any answer that comes your way. Turns out when cleaning out my office at the college (I retired in December) I too came across a EV 630 and want to use it with my Drake T-4XB. I don't have the connecting cable and need to find one that will fit the 3-pin socket. How is yours wired?

Mike

Mine has the four pin plug at the base of the mic head. It is mounted on a chrome flexable stand about 14" long. If you are missing the necessary connecting cable and such, assuming that someone verifies my "dead" element finding, you're welcome to this one. Assuming you have a good element in yours.

The main reason I wanted to use this one is that it would allow for hands free operation and would be the perfect height for me.

I have mine pinned for high Z. A quick google search produces a PDF manual for the mic. I'm sure this one is dead, I was just hoping someone would have an idea how to reassurect the element. There are no obvious coil wire problems. I checked all solder joints etc. I even "touched" up the solder joints on the element itself.

12530. Is DeOxit really conductive? Maker says no.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-13 00:57:03 UTC
From: k9sqg
Topic: 12530 Message: 12530

DeoxIT® is NOT conductive, however, phenolic is composed of multiple layers of material and readily absorbs liquid. As a result, any product that contains a conductive material should not be used. Most manufactures include alcohol in their contact cleaners, lubricants and preservatives (even very small percentages), and alcohol will cause short circuits.

DeoxIT®, DeoxIT® GOLD, DeoxIT® SHIELD, DeoxIT® FaderLube liquids are completely non-conductive, and neither the 100% liquids or the 5% spray versions contain alcohol or any other conductive constituents.

Warnings should be issued cautioning technicians from using any contact cleaners containing alcohol. This is one of the most common misuses of contact cleaners.

Also, the use of silicone in any type of contact cleaning solutions should be avoided because it can be detrimental to the long-term performance of the contact or switch because it will degrade phenolics and plastics over time.

DeoxIT ® is used for many applications including telephone switching systems that contain phenolic materials. Care should be taken to reduce exposure of any materials, including DeoxIT ® to phenolic materials due to its porosity.

Even superior phenolics over long periods of time degrade, and thereby more easily absorb any materials, whether it be DeoxIT ® or any other product. To prevent this from happening, we offer many applicators to assist the technician in applying our products to the metal surfaces directly without concern with over-spray on to the phenolic materials.

If a spray version is required due to inaccessibility of a contact area, we recommend our DeoxIT ® (D100S-2) 100% spray, which contains no solvent. This version reduces potential over-spray by confining the product to a controlled area without migration of solvent.

The DeoxIT ® 100% solution is safe for use on energized circuits, as is our new non-flammable DeoxIT ® DN5 (DN5MS-15) spray.

Our most popular DeoxIT ® D5 (D5S-6; flush - slow dry) is not recommended for energized circuits due to the fact that it contains a flammable solvent. We always recommend turning equipment off prior to application, and waiting two minutes before turning the equipment back on.

This caution is due to the brief flammability of the solvent, not the conductivity of the solvent. If the energized system arcs, it could cause a flash, thus causing damage to relay contacts, power contacts, commutators, etc.

Finally, DeoxIT ® spray is not recommended for rosin flux removal.

Data sheets may be found at:
www.electrovoice.com/downloadfile.php?i=970567

and www.coutant.org/ev630/index.html

Make sure you know what you are measuring. To check the element you will have to open the head. I have an EV 635 which is similar, the head has two screws in it which release the front part. You will find the wiring to the element there and can measure directly across it. The VOM will not hurt it. Also remove the switch and check the wiring there to make sure there is not an open. The switch shorts the element.
For high impedance there is a transformer, it may have an open winding or bad wiring. My 635 is intermittant because a couple of the wires between the transformer and switch have are broken inside the insulation. Not easy to fix because of the construction.
The 630 is the same as the 635 but the elements in the 635 were selected to have somewhat more extended high

frequency response. The 635 is also only low impedance.

I have run across a couple of instances where the wire
from the voice coil was broken where it is brought out
across the diaphragm. Not much you can do about this. I
had one old EV broadcast lavaliere mic where the voice coil
leads had just rotted away. Mostly, these are very rugged
mics and the plastic diaphragms are indestructible but
wiring problems seem to be fairly common.

NEVER check a mic with an ohm meter. Not a good practice
Those are very fine windings on the voice coil and if it is crystal or
ceramic element that can also be damaged
ALWAYS use a scope and observe the pattern and amplitude

Richard,

I checked every one of those points. I also removed the head and pulled out the element. I quickly unsoldered the element from the red and green connection leads. The element shows open when ohm'd. Connecting for a millivolt reading the meter shows no response to a whistle. These were the last to checks that I made.

So, I'm assuming my "dead element" assumption was correct.

12538. My non-working TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-13 02:08:13 UTC
From: Howard Traxler
Topic: 12538 Message: 12538

Hi all,
after this long time, I'm finally getting at my TR-4. One day it just stopped receiving. What I can hear yet is a hum and very faint rushing sound from the speaker. The sound is affected slightly by the AF volume control. A light click in the speaker occurs when switching between CAL, TUN, SSB, and AM. There is a noise like the relay clicking when I key the mic or key jack. All the tubes outside the final cage (that I can find) are at least warm to the touch.

I'm thinking of listening for local oscilators on a separate radio--if I knew where to listen; or of injecting signals of various types into different stages starting at the receive audio and moving back.

Would anyone have some suggestions or specific instructions for me? I hope I don't have to send her away for repair. Thank you anybody.

73,
Howard, WA9RYF

Howard,

Something I am ALWAYS doing if I ever move my TR4C is move the switch on the side from transceive to run the external receiver. That would be worth a look until Garey shows up, hi. Even have found a couple of defective switches there over the years.

Also, check the #12 lamp (receiver protector). Can be the bulb or corroded connections in the socket.

Hope these tips help.

Evan -

No DeoxIT is NOT conductive itself. It DOES however leave a lubricant, which attracts and holds
dust, which may carbonize and form conductive paths.

Spray cleaners, unless they are one of a few 'zero residue' types, should never be sprayed on
electronics!

Alcohol isn't great, because it holds water which CAN absorb into 'some' phenolic material.

Lot's of 'may', 'can', 'might', 'could', etc.!! :-)

Well, there are two locations for the bulb and my old brain forgets which one is which. One of the TR4's it is under the chassis, near the antenna connector and relay, the other one is in the final compartment. Look closely in that area very near the antenna connector and you will see it plugged into a socket. The contacts are most suspect, unless you had a transmitter too close and blew the bulb.

Probably. I would examine the solder points with a magnifier, the magnet wire is weakest where it joins the solder. You may have a break there that can be patched.

I know someone who may be able to repair it of you are so inclined, he used to do factory repair for ElectroVoice and is a vintage mic afficionado. He's quite skilled at refurbishing vintage pro-audio mics. Otherwise, you could put a more modern element in the housing. If nothing else, there are collectors out there who would give you $$ for the dead mic.

The 630, being a dynamic mic, would be less "crisp" than the D-104, but should sound very natural. It will have some "proximity effect",
an increase in bass response as you speak closer to the mic.

Okay, thank you for your advice. I'll try the fix this weekend and get back to the group to let you know how it turns out.

73,

Carl, KJ6BSO

My TR7 did this to me a month ago - like many others here I found that cleaning the pins and sockets on the cards located under the DR7 board fixed the problem. You'll need lots of patience to get the DR7 out, take off the cover over the cards that are under it and remove each card one at a time. Spray the Molex pins with De-Oxit, wipe clean, spray a tiny bit of De-Oxit into the socket the board mounts to, give it some time to evaporate, and then reinstall the card. I did the whole procedure over several nights but I am really slow.

Steve
KD2ed

In a message dated 3/11/2013 9:23:56 P.M. Eastern Daylight Time, kj6bso@... writes:

Hello, all--

My TR-7 recently developed a glitch: It works properly when I first turn it on but after about ten minutes, the tuned frequency will drop exactly 500 kHz. Once this has happened, pressing either the "UP" or "DOWN" keys, changes the frequency in 1 MHz increments rather than the normal 500 kHz step, although the LED display will flash the 500 kHz increment for a fraction of a second on the way past. A quick off-on power cycle doesn't eliminate the problem; letting it sit overnight does, which leads me to believe it's a thermal issue. I have not yet had the opportunity to test how long it needs to be powered down before it returns to normal operation.

Any ideas on why this is happening and how I might go about fixing it?

Well, I think you are right. Did you look at the voice
coil leads at the terminals of the capsule. It sounds as
though you did. Sometimes the leads come loose from the
terminals so its worth inspecting this closely. One would
expect that resoldering the wires from the body of the mic
would also resolder these but perhaps not. Anyway, you
can't loose anything by looking.
Its possible the voice coil opened up or was burned out
by an application of a lot of power but the coils are a lot
more rugged than you would think.
I just hate to give up on things and these are pretty
good microphones.

Freon TF. If you can find any, and that's a BIG "if" thanks to the environmental so-and-so's. Used to be the industry standard. Good luck getting all the grease out of there without disassembly or damage otherwise-

I doubt it is an issue either but when someone says VOM I have to assume the worst and would rather advise on the side of caution than have someone come back saying my advice hurt something
Scope is best, VTVM or solid state equivalent also ok, or even a audio amp sitting on bench as a test device

From: Howard Traxler
Topic: 12538 Message: 12553

Thanks Don, I'll give it a "look". What are the properties of the bulb? Can I burn it out with an ohm meter or continuity tester? If it is burned out, I bet it's not a good idea to just twist the wires together, hi hi.

73,
Howard

Well, there are two locations for the bulb and my old brain forgets which one is which. One of the TR4's it is under the chassis, near the antenna connector and relay, the other one is in the final compartment. Look closely in that area very near the antenna connector and you will see it plugged into a socket. The contacts are most suspect, unless you had a transmitter too close and blew the bulb.
73,
Don

12555. 39.1 MHz Crystal

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-13 14:48:16 UTC
From: Al
Topic: 12555 Message: 12555

I was wondering if anyone has a 39.1 MHz crystal they are willing to part with at a reasonable price.
My R-4A only has a crystal for the 28.5 to 29.0 MHz part of the 10 meter band. I would like to receive on 28.0 to 28.5, which has much more activity.

Thanks,
Al, WA2S

Howard,

I am NOT the "guru" here, just trying to help when it looked like no one was answering you. The TR4 was really considered to be a nice mobile rig in its time, and the KW plus CB rig was just as common. The bulb was to protect the receiver front end from heavy RF. I think I remember Garey saying it has the properties of the #47 lamp, but don't quote me on that. I don't think it would hurt to bypass the lamp to test, but I would replace it when you can.

I'll bow out and return to my cave.
73,
Don, WB5HAK

Howard -

That's a #12 bulb. Available from several of the on-line bulb dealers. Electrically identical to a
#47 bulb, just with a bi-pin base.

Hardly EVER see a bad bulb, usually corrosion on the pins or the socket. DeoxIT should clear up the
problem if that is the cause.

You CAN short it out, certainly for test purposes, and probably on a permanent basis unless you run
the radio mobile. It's there to protect the receiver front end IF when operating mobile you pull
up alongside a 500W CB in a truck. Unless you have multiple antennas at home, and operatemultiple
rigs with ALL connected to their own antenna, the bulb isn't necessary.

I assume it wasn't the slide switch on the side.?

Do you have PA idle current when PTT is closed?

Next would be to verify that all tubes are 'lit', and then 'rock' each tube in it's socket a few
times. Not the PA tubes.

Topic: 12538 Message: 12558

Yeh, I tried the switch a few times. I'm thinking that moving that switch back and forth should change some reading or continuity across the so-239 or maybe one or both of those rca jacks on the back I could check.

Are the three finals the only tubes in the final cage?

It's hard to physically check all the tubes. There are so many I get confused.

Would that protection bulb be inside the cage with the finals?

What frequency can I listen to to hear local oscilators from the receiver?

These answers will give me something to do a while. Thanks to you and Don.

12560. Crystals wanted for 17 meters (and 60 meters?)

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-13 15:51:05 UTC
From: Charles Ring
Topic: 12555 Message: 12560

Looking for a 29.1 MHz crystal to cover 18.0 to 18.5 MHz on my R-4B and R-4C. I was lucky to already have crystals to cover 30 and 12 meters.

Also, I'd like to know what to expect if I find and use a 16.1 MHz crystal for 5.0-5.5 MHz to cover the 60 meter channels. I know don't try to transmit with the 4 line there.

I recently bought a set of warc band crystals for my R4B from International Crystal. They know all the constants. The required frequencies are in the handbook. They were about $20 each. I don't have a 60 meter crystal since that does not appear to be a useful band. I think its in the "forbidden" range of the RX due to being close to one of the IF frequencies. I suspect it will receive there but may have too many spurious responses. For the WARC bands I use the transceive function with the receiver controlling the T4XB frequency. The 30 meter crystal also gets me WWV so I can check the calibrator directly.

I don't know what is "reasonable" but you can buy brand new crystals from International Crystal for about $20 each. They know the constants for the crystals. The chart in the handbook will tell you the crystal frequencies required. I've bought several crystals from ICM for both Drake and Collins receivers, all were right on the nose.

On 40M the Carrier Oscillator runs at 9.000 MHz, the PTO covers 5.455 t0 4.955 MHz from 0-500, and
the crystal oscillator runs at 21.5 MHz.

Yes, only PA tubes inside the cage.

Don't remove tubes from sockets, just rock them back and forth a little one at a time.

Yes, the bulb is inside the cage, on top of the chassis. It's round about 1/4" in dia.

I think Tri-chlor was more common, also an environmental no-no (and for good reason). I don't know what the gears in the TR-7 are made of. If plastic you will have to test to make sure that whatever solvent you use does not damage them. In general good solvents for degreasing are dry isopropyl alcohol and naphtha. Isopropyl alcohol (AKA isopropanol) absorbs water until it reaches 91% so is not regularly sold at greater concentrations. However, it is available as 99+ % from many stores that sell computer supplies. The problem is that any moisture in the alcohol is left when it evaporates. Naphtha is also sold as lighter fluid. Its main drawback is that its quite inflammable. However pure naphtha does not leave a residue. It is available at most stores that sell paint. Kerosene (called paraffin oil or just paraffin in England) is also an effective degreaser but leaves an oily residue which must then be cleaned off using naphtha. All three of these are relatively safe around plastics and most paint but not al so test. Other common solvents like xylol (AKA xylene) or acetone will directly attack many plastics and paint. Apply the solvent with a small brush rather than spraying it.
Brass gears do not need lubrication, steel gears do.
There is some controversy about plastic gears. Most are nylon or delrin and can probably run dry. It appears that some greases will eventually cause nylon to swell up and even crack.

I would think a 5% isopropanol solution, should be good. But, certainly, test it first, in a non visible area. If that's too volatile, orange oil solvent, seems to be the miracle cleaner, currently. I think I might give it a try. Also, if you can get a cloth on the area, maybe some of those cleaning/disinfectant wipes, that seem to be everywhere now, might be good. I use them to Kees all of my boat anchors clean, and have never had them damage anything.

Richard,

Thanks for all of the information. I do not give up easily either that's why I was hoping someone would have a pointer or two; which you did.

Inspecting the mic element today, I noticed the coil wires were evaporated just under the plastic element. I carefully removed the plastic, gently unraveled the wire, enough to make it back out to the terminals and re-soldered. I then measured across the terminals and viola, I had 150 ohms. While attempting to reassemble the coil and plastic element, my big hands managed to break the wire again. This time when I attempted to unravel more wire, it turned into a birds nest. I had it under control and now it is ruined most definitely.

I did a couple of google searches however; I wasn't successful in sourcing any replacement parts. Because I'm not a collector of these units, I don't want to spend a huge amount of money on it however; if I could spend a reasonable amount of money to make it functional again, I most likely would.

Thanks for all your help,

Doug

Kudos for trying, Doug. I can't even count the number of times that I fixed something that couldn't be fixed, just because I tried.

The older mics are not supported by EV anymore, that's the way of things these days. Contact me off-list if you want the name of my friend that repairs this stuff. He may know of a parts source, if nothing else.

Someone had posted earlier that he thought he'd noticed that the numbering was internal on the discs. Not sure whether that's true or not: I know that you can see raised areas on the B-Line discs but I can't remember which side. I limit the washing of the discs to dishwashing soap (i.e., Joy, Dawn, etc.) and then rinse with distilled water to prevent spotting.

Good for you to have given it a try. Its not an easy repair. I would hang on to the case for the parts, for instance you might need the transformer for something. It will work as a matching transformer for low to high impedance mics.
The 630 was sold mostly for public address use. The 635 was similar but made for broadcast use. I suspect that the elements in the 635 were selected to have slightly better performance. I am not sure if EV was the first to use Mylar diaphragms but may well have been. One advantage is that the uniformity of the diaphragms is far better than those made of metal so the performance of individual mics does not vary much. Its also very rugged; you can push your finger

into an Acoustalloy diaphragm without damaging it while that will ruin a metal diaphragm. RCA used plastic diaphragms on some microphones going back to the 88-A but I don't know what it was made of. These diaphragms did not yield very good high frequency response but were pretty much weatherproof. Mylar diaphragms were as light weight (properly low mass) as aluminum so the HF response was at least as good. The EV 655 had flat response to 15K and the 655C to 20K, unheard of in a moving coil dynamic at the time.

EV's use of Mylar diaphragms and their Variable-D cardioid principle blew almost everyone else out of the water for broadcast microphones. EV mics were not expensive, light weight, extremely reliable, extremely durable, and had quite good audio quality.

The microphone that came to be known as a Buchanan Hammer was the model 650. This was a dynamic with response to 15K and high output that was shaped like a hammer. Lou Burroughs, of EV, used to demonstrate their ruggedness by hammering nails with them. Sometime around 1950 WJR in Detroit, a CBS affil with lots of local production, dumped all their RCA and WE mics and replaced them with 650s. EV ran an ad showing them all. I wish I knew any interesting Drake stuff.

Does anyone know what type of paint that could be used to highlight the arrows on the knobs? Think they were silver colored.

Also does anyone know where you can obtain Drake Knobs for the 2B?

I took a different approach
I think it looks GREAT
Get some of that metal foil tape like the HVAC guys use to seal the seams in ductwork
Put a small piece on the pointer part
Push it down firmly with an x acto knife and cut the outline against the knob and voilla. Chrome finish without being gaudy. Stays nice and crisp over the years too. Blends nice with the chrome ring insert on the knob too
I can photobucket or email pix if anybody wants to see
BTW FWIW the stuff works great to seal a box for rf. Doing some experimenting and just need a quickie enclosure? Cardboard box sealed with metal tape. Even has good continuity where overlapped
Just had to share that one

I can't believe I missed winning the latest "TR-44B" by only about $40. It sold for under $500 - which is less than a decent set of B-Twins normally brings!

So, how scarce, exactly, are these things? The last one that was up on eBay (admittedly - it was a 9.8/10) went for nearly $1500.

Opinions?

12573. RV-4C VFO knob semi-difficult to turn

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-14 01:44:16 UTC
From: slowcountry1
Topic: 12573 Message: 12573

As I am returning my Drake equipment to service, I pulled my RV-4C out of the closet. I purchased it 10 years ago tested it, placed it in the closet and never used it. The VFO knob turned very harshly so I disassembled the dial / gear assembly, replaced the bearing grease, cleaned the dials etc. The VFO knob turns much smoother however; it still has a significant amount of resistance and a little bit of "jerking" at points. With the dials removed, everything turns very smooth. I added the slightest film of petroleum jelly between the dials and the plastic disc that separates them. In addition, I set out the locking ring just a touch. This helped some however; it is still not anywhere near as smooth as expected. All of the gears are plastic which I did not grease. The main resistance seems to be between the dials.

When I did the a fore mentioned treatment to my TR-4Cw, the VFO now turns like a dream; granted it uses brass gears and such. I'm not sure if this is just normal for the RV-4C or if something else is amiss. The previous owner had the VFO knob and selector switch set in too far causing scars on the face. I'm wondering if something else was left out of order however; I do not see anything obvious.

I really don't expect to use the RV-4C much, but it needs to be set up with the rest of the gear. I figured it should work as good as I can make it. Any suggestions would be appreciated.

Thanks,

Doug Coffman

Hi Doug.

Just another data point...

I just finished getting my RV-4C working. While the dial is not as "light" as the one on the TR-4 I'm also bringing back to life (I need to do a transmit test before I write everything up for the forum) it is still fairly light.

When I look at the dial gears, there does appear to be some sort of lubricant on them. I don't know whether or not it is supposed to be there. (I expect not; but I don't know for sure.)

As I said, just another data point... :-)

I've got two RE-20s and an RE-320 in the collection now. If I ever get the time, they will get plugged in to a Drake and I'll have some fun doing mic comparisons. Also a few EV PL-line dynamic and condensers, but the REs interest me the most ATM.

If you are talking about the stacked R4B/T4B that just sold on EvilBay for $414, that was NOT a TR-44B.

Glad you got it working. For future reference, wholesale replacement of all the tunes just because you can is generally not recommended, for various reasons. It's usually best just to replace the bad one and be happy.

The RE-20 was designed for radio announcing and has a
very flattering voice sound. EV had slowly rolled off the
low end on many of their mics beginning with the 666R and I
found them somewhat thin sounding for studio recording. The
RE-20 was supposed to have a little of the old ribbon mic
sound. They became very popular for radio. They are also in
well protected case with nested shock mounts. I am not
familiar with the RE-320 as far as sound. I left the sound
end of things too long ago and can't hear any more so I am
hors de combat about comparing microphones, loudspeakers,
etc. Very frustrating!
EV had a fellow named Alpha M. Wiggins working for them
as a designer. Wiggins was the inventor of the Variable-D
principle for obtaining a cardioid pattern from a moving
coil microphone and also designed the Electro-Voice
Circlotron audio amplifier. I won't try to explain how a
cardioid works here but EV's method of generating it did not
produce the "proximity effect" common to all gradient type
microphones. The proximity effect is what causes the

increase in bass response when used close to the source. It also allows the use of a dynamic element that is resistance controlled (acoustical resistance that is) rather than mass controlled. The practical result is far less sensitivity to conducted vibration so there is no more rumble than from a non-directional microphone. Also, because EV was able to make their cardioid microphones mechanically symmetrical the polar pattern was also symmetrical, a great advantage for many applications. For comparison a 666 or RE-15 or RE-20 has a pattern which is a true cardioid of revolution where a microphone with non-symmetrical diaphragm or case such as the famous RCA 77-DX, or BK-5 or KU-2 has a pattern that is a cardioid only in one plane. This is audible where there is considerable background noise or reverberation because the frequency response of the microphone off axis is far from flat plus its directional discrimination is not very good. RCA was honest enough to publish the curves for their broadcast microphones but many other manufacturers were not. Despite the advantages I never liked EV mics for studio recording. On a piano the RE-15 sounded to me like it had a peak limiter in the circuit where a 77D did not and reproduced the piano strike tones better. I also never liked EV mics on drums but others did. As far as that goes the famous Shure mics to my ear made drums sound like someone beating on cardboard boxes. For reference my favorites were mostly Neumann condenser mics and Schoeps condensers. Well, my hearing now makes everything sound like it has a clipper working. I am going to find out if anything can be done about that. I can think of worse things that can happen when you get old.

I'm intimately familiar with the internals of the RE-20 at this point. Without going into detail, I'll just say that I know the fellow who repairs them. :) He has taught me a thing or two. The 320 looks like essentially a charcoal black RE-20, is made offshore, and is pretty much an RE-27 element in an RE-20 housing. As such, from what I am told it is a little brighter than an RE-20. It was designed as primarily a kick drum mic, so the EQ options are a little different, but I'm reading that lots of folks like them for vocal use as well.

The RE-20 cartridge is quite interesting to look at, different in size and shape than just about any other dynamic you'll see. Only true microphone geeks would probably appreciate it. I probably shouldn't say too much about how it actually works, although it's probably common knowledge in the industry after all these years... The humbucking coil was also an EV innovation. The RE-27 and RE-320 are similar in concept, but the construction of the cartridge is entirely different mechanically.

These discussions about microphone technology are very interesting. They've always been a little mysterious to me.

Back when I knew something about ham radio, I only did CW, but I remember two mikes by electrovoice, the 664 and 638 that were popular.

Does anyone know anything about these two?

I've got a couple of D104's that aren't working at the moment, and I suppose that the crystal elements are kaput, but that's good for another thread, I guess.

Thanks. Both you and Garey provided essentially the same response.

Over the years I have used flame proof metal oxide and flame proof carbon film resistors purchased from Dave at Just Radios, http://www.justradios.com/resistors.html#product.
Both types are +/- 5%, and come in 1/2W, 1W, and 2W sizes.

According to the literature they are made with a vapor or spray of tin chloride or tin-oxide film over a high thermal conductive rod or by vacuum depositing a thin film of carbon over a high thermal conductive ceramic rod. No mention of a spiral trace or other inductor-creating structure is mentioned. I have never had trouble using them anywhere in a circuit.

I will give the Ohmites a try but will also order more of the flame proof resistors from Dave to replenish my stock.

Ken -

This message got trapped in Yahoo's SPAM filter. I didn't know they had one! :-)

Anyway, just found it.. There's nothing 'wrong' with those resistors, even though I believe they
are spiral etched to adjust value. The amount of inductance is negligible. The weakness is that
they do not handle current surges well at all, as there is very little mass to the resistive
element. So a surge has no where to go to 'slow' it down. Carbonor ceramic comps, by contrast, are
a pretty big lump of material so a brief surge is better absorbed. The Cathode resistors in the PA
are subject to surge currents, as much as 500 mA or more, especially when tuning.

All that said, they may work fine! There are fewer and fewer choices available today, especially
with everything going surface mount! :-)

Keep us posted!!

Garey,

With all of the idiots staying awake at night plotting ways to screw with our data this "lost in the spam filter" problem is happening more often. I would rather that than a loss of data...

As for the resistors, I agree with the surge issue but my thought is that a 2W flame proof metal oxide or flame proof carbon film device used in place of the specified 1W cathode resistors would be OK due to the increased dissipation ability of the higher wattage unit. Since the 2W devices are about the size of a 1W carbon comp it should fit in there w/o a problem and, hopefully, provide the surge "margin" we want.

Regardless, this may become a moot point because, as you noted, we are running out of choices as more surface mount devices come on the market. We need to seek alternatives now.

Well the actual TR-44 (of which I have a complete unmolested TR-44B) are definitely rare, but not sure how rare... I know they exists in a few hands that frequent this group, however, to be honest, mine is the only one that I have ever seen live. I never see them for sale.

12604. TR-4 15m coils for TX adjustment

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-14 21:13:31 UTC
From: JoÃ£o Lopes
Topic: 12604 Message: 12604

Dear friends.
I friend of mine has a TR-4 with a pair of fixed coils (no adjustments) for 15m. Other colleague told us that should be have a ferrite inside this simple coils glued internally. According him for 11 meter mod people take out these ferrites?

Is it real?

The problem is that 15m in his radio tx is weak, only 40W maximum.

Can you give some support?

regards and 73s.

Lopes - PY2SM

Garey,

Thanks again. I'm not sure why my Google search did not produce this website; I had totally forgotten about his site and its resources.

I followed his advice and ended up with a much smoother VFO. It still isn't quite as "silky" as the TR-4Cw but its very close; as close as I'm going to get it anyway.

This weekend, I hope to inspect the L-4 amp; I replaced the caps and diodes before I put it to rest 8 years ago. I need to open everything up and blow the dust and debris out. I need to replace the seal on the pressurized air compartment as It was on its last leg when I last used it. I need to check the fan to see if it needs any care. Should I inspect anything prior to putting it into service? The tubes are date code 1968 so its going to be a crap shoot if they have held their vacuum; really hoping there are no arcs.

This will complete the setup of this Drake station. I have three other TR-4's and one TR-6 to go through however; that's for later in the summer.

Thanks for all you do for the ham community,

Doug Coffman

Sent: Wednesday, March 13, 2013 10:48 AM
To: DrakeRadio@yahoogroups.com
Subject: [DrakeRadio] 39.1 MHz Crystal

I was wondering if anyone has a 39.1 MHz crystal they are willing to part with at a reasonable price.
My R-4A only has a crystal for the 28.5 to 29.0 MHz part of the 10 meter band. I would like to receive on 28.0 to 28.5, which has much more activity.

Thanks,
Al, WA2S

No, just run the filaments for a couple of hoursbefore applying HV. Probably not necessary, but
can't hurt.

Steve:

The stacked set that was on epay was simply a standard R-4B and T-4XB in a CA-1 Stacking Cabinet. You remove the top cabinet of the R-4B leaving the bottom in place, mount the CA-1 in place of the receiver cabinet top, remove the bottom of the transmitter and mount the tx on top of the CA-1. Result is what you saw. You still need to add an external speaker and of course an AC-4. Typically the tx/rx connecting cables are the standard ~3 foot cables you see with any B/C line.

The TR-44B was a special version of the above assembly that eliminated the transmitter's VFO and replaced it with a speaker/grill that is almost identical to what you see in an RV-4 or RV-4C. It uses a special transmitter cabinet top that has a snap out cover on the right side (as you face the unit) that has (I believe – not at home to check) 10 spare 5 Mhz VFO xtal positions. These are switched from the front panel in the same place where the 4 position auxiliary dial range switch is on the T-4XB. A switch on the front panel selects the RCV VFO or the Xtals for tx frequency. A pilot light indicates non-R4B VFO control.

There is an RCA jack mounted in one of the spare holes on the back of the transmitter for connecting the speaker cable from the receiver. The tx/rx connecting cables are all short – about 6 or 8" long only – no need for long ones of course as they are always together.

There is a metal label on the side that states this is a TR-44B Communications Station. See Bob, VE3UK's, pics of a real TR-44B in the files section of this group.

The TR-44B was used for many government agencies and civil defense units, as I understand, but I am sure there are others on here that can shed further or more accurate history. There seemed to be a lot of them used in Ohio. They do show up on the auction sites fairly often and prices vary wildly.

The TR-44C version is MUCH more rare. I know of only three, including mine. Mine came with evidence that it was used at an Austrian embassy in Cairo, Egypt. It is on almost every evening. Will try to post some pics to the files section next week. Sindre had some on his and JM Cherry's web site but Sindre's new site doesn't yet have a pic of it, or didn't at last check a few weeks ago.

I have never seen a T-4B reciter, which is essentially the transmitter part of the TR-44B, but I suspect it does not have the speaker/grill like it's counterpart in the TR-44B. Of course I could be wrong on that assumption. I know the earlier T-4 Reciter had no speaker/grill. As far as I know there was no TR-44 Comm station predating the TR-44B, although it is not uncommon to see an R-4 or R-4A and T-4 Reciter mounted in a CA-1 stacking cabinet.

I'm doing all his from memory – hope it's mostly correct!

Hi everybody,

Peter VE3AX/7 explains the differencies between the TR-44, TR-44B and TR-44C very well ! There was actually a TR-44 predating the more common TR-44B, but it used the T-4 reciter without any speaker grill as explained. The label says TR-44!
I have never seen any T-4 with the speaker grill, and I have never seen any T-4B without the grill either.

The TR-44C is probably the most rare of the three versions mentioned above. I have one myself with the metal modeltype label on the side.
All my TR-44 versions come from Sweden. The Swedish Ministry of Foreign Affairs used them on all of their embassies around the world. The most common were the TR-44B in conjuntion with teletype equipment made by TeleTrading in Denmark. These units were housed in cabinets of the same size as the 4-line by the way. Looks very nice indeed.
They got only one TR-44C from Drake, but that one was never put into service.

Drake delivered different setups for Sweden on demand: a few TR-44B's but with the T-4XB transmitter; so the TR-44B version from Drake with the T-4XB and R-4B did come from the factory in limited quantity. And at the embassy in Moscow Sweden had a special TR-44B with the SPR-4 receiver instead of the R-4B.
I have all units in my collection thanks to a very good contact that I had in the department of state in Stockholm.

I'm going to present all the equipment at The Virtual Drake Museum. I have not had much time lately to work with that one by the way. But that will change to the better for me. I'm ending my job as editor of The Norwegian Hamradio Magazine issued by NRRL by the end of May. I'm going to spend a lot more time working with the museumsite after that.

Thanks, Peter. Now I do recall hearing that description. Someone on this list - can't remember if it was Bob or Pete - had a T-4B, which is also a rare bird. Unfortunately, the one he owned had an extra hole in the front panel I believe it still went for a healthy amount of money.

You probably remember seeing that stacked set that was on eBay back in January, I believe it was. This one was in mint shape but the $1400+ sale price was eye-popping!

I'd suspect that a typical price for the stack would be somewhat more than a set of twins, so whoever won this one did get a good deal regardless.

Thanks for the info!

You all have my attention now! So is the "TR-44C" I have real? or is it just stacked with the CA1 cabinet. Bought off eBay a couple years ago and the seller sold it as a TR-44C.

Thanks!

Wayne

Update:
It's always the dumb stuff....the translator board is a tight fit past a couple of screws that mount a shield cover, and it's really easy to slide it into it's compartment a skoshe angled, so the connector pins slide across the shields on the board and short things...
Finally figured it out, and replaced the +10 pass transistor (Thank you American microsemiconductor, speedy purveyors of "legacy" silicon). I can hear the calibrator and have RF out with the digital jumper board in place; not to put everything back together in stages and try not to mess anything else up on the way.

Good morning everyone!

Sindre – good to hear from you! Great info indeed and thanks for the correction on the T-4B speaker. I wondered about that – I remember seeing ads for the T-4B reciter when I was a kid but have not seen one in a long time. Good info on the TR-44 too.

Wayne – if there is a metal tag on the (left?) side that is printed with TR-44C, then it's real. A "standard" TR-44C would have the RV-4C-like speaker and grill where the T-4XC VFO is and a 10 position "VFO" xtal switch bottom right corner as you face it, and the xtal door with 10 xtal sockets on the right side. The tx part is actually a T-4C Reciter. But as Sindre has stated, Drake made special units, at least in the B version, that included a full tx and rx with both VFO's. The metal tag (about 3" square) would be the best indicator.

Does it have short (6-8" long) connecting cables between tx and rx?

Subject: Re: [DrakeRadio] Re: Okay, so how rare are they?

Hi everybody,

Peter VE3AX/7 explains the differencies between the TR-44, TR-44B and TR-44C very well ! There was actually a TR-44 predating the more common TR-44B, but it used the T-4 reciter without any speaker grill as explained. The label says TR-44!
I have never seen any T-4 with the speaker grill, and I have never seen any T-4B without the grill either.

The TR-44C is probably the most rare of the three versions mentioned above. I have one myself with the metal modeltype label on the side.
All my TR-44 versions come from Sweden. The Swedish Ministry of Foreign Affairs used them on all of their embassies around the world. The most common were the TR-44B in conjuntion with teletype equipment made by TeleTrading in Denmark. These units were housed in cabinets of the same size as the 4-line by the way. Looks very nice indeed.
They got only one TR-44C from Drake, but that one was never put into service.

Drake delivered different setups for Sweden on demand: a few TR-44B's but with the T-4XB transmitter; so the TR-44B version from Drake with the T-4XB and R-4B did come from the factory in limited quantity. And at the embassy in Moscow Sweden had a special TR-44B with the SPR-4 receiver instead of the R-4B.
I have all units in my collection thanks to a very good contact that I had in the department of state in Stockholm.

I'm going to present all the equipment at The Virtual Drake Museum. I have not had much time lately to work with that one by the way. But that will change to the better for me. I'm ending my job as editor of The Norwegian Hamradio Magazine issued by NRRL by the end of May. I'm going to spend a lot more time working with the museumsite after that.

Subject: Re: [DrakeRadio] Re: Okay, so how rare are they?

Steve:

The stacked set that was on epay was simply a standard R-4B and T-4XB in a CA-1 Stacking Cabinet. You remove the top cabinet of the R-4B leaving the bottom in place, mount the CA-1 in place of the receiver cabinet top, remove the bottom of the transmitter and mount the tx on top of the CA-1. Result is what you saw. You still need to add an external speaker and of course an AC-4. Typically the tx/rx connecting cables are the standard ~3 foot cables you see with any B/C line.

The TR-44B was a special version of the above assembly that eliminated the transmitter’s VFO and replaced it with a speaker/grill that is almost identical to what you see in an RV-4 or RV-4C. It uses a special transmitter cabinet top that has a snap out cover on the right side (as you face the unit) that has (I believe – not at home to check) 10 spare 5 Mhz VFO xtal positions. These are switched from the front panel in the same place where the 4 position auxiliary dial range switch is on the T-4XB. A switch on the front panel selects the RCV VFO or the Xtals for tx frequency. A pilot light indicates non-R4B VFO control.

There is an RCA jack mounted in one of the spare holes on the back of the transmitter for connecting the speaker cable from the receiver. The tx/rx connecting cables are all short – about 6 or 8” long only – no need for long ones of course as they are always together.

There is a metal label on the side that states this is a TR-44B Communications Station. See Bob, VE3UK’s, pics of a real TR-44B in the files section of this group.

The TR-44B was used for many government agencies and civil defense units, as I understand, but I am sure there are others on here that can shed further or more accurate history. There seemed to be a lot of them used in Ohio. They do show up on the auction sites fairly often and prices vary wildly.

The TR-44C version is MUCH more rare. I know of only three, including mine. Mine came with evidence that it was used at an Austrian embassy in Cairo, Egypt. It is on almost every evening. Will try to post some pics to the files section next week. Sindre had some on his and JM Cherry's web site but Sindre's new site doesn't yet have a pic of it, or didn't at last check a few weeks ago.

I have never seen a T-4B reciter, which is essentially the transmitter part of the TR-44B, but I suspect it does not have the speaker/grill like it's counterpart in the TR-44B. Of course I could be wrong on that assumption. I know the earlier T-4 Reciter had no speaker/grill. As far as I know there was no TR-44 Comm station predating the TR-44B, although it is not uncommon to see an R-4 or R-4A and T-4 Reciter mounted in a CA-1 stacking cabinet.

I'm doing all his from memory – hope it's mostly correct!

Wayne:

There is a pic of a TR-44C here:

http://www.mods.dk/picture.php?brandid=14&model=tr-44c

It doesn't show the short cables, or tx xtal deck/door but you can see the TR-44C label and the T-4C reciter/speaker.

Steve:

The stacked set that was on epay was simply a standard R-4B and T-4XB in a CA-1 Stacking Cabinet. You remove the top cabinet of the R-4B leaving the bottom in place, mount the CA-1 in place of the receiver cabinet top, remove the bottom of the transmitter and mount the tx on top of the CA-1. Result is what you saw. You still need to add an external speaker and of course an AC-4. Typically the tx/rx connecting cables are the standard ~3 foot cables you see with any B/C line.

The TR-44B was a special version of the above assembly that eliminated the transmitter's VFO and replaced it with a speaker/grill that is almost identical to what you see in an RV-4 or RV-4C. It uses a special transmitter cabinet top that has a snap out cover on the right side (as you face the unit) that has (I believe – not at home to check) 10 spare 5 Mhz VFO xtal positions. These are switched from the front panel in the same place where the 4 position auxiliary dial range switch is on the T-4XB. A switch on the front panel selects the RCV VFO or the Xtals for tx frequency. A pilot light indicates non-R4B VFO control.

There is an RCA jack mounted in one of the spare holes on the back of the transmitter for connecting the speaker cable from the receiver. The tx/rx connecting cables are all short – about 6 or 8" long only – no need for long ones of course as they are always together.

There is a metal label on the side that states this is a TR-44B Communications Station. See Bob, VE3UK's, pics of a real TR-44B in the files section of this group.

The TR-44B was used for many government agencies and civil defense units, as I understand, but I am sure there are others on here that can shed further or more accurate history. There seemed to be a lot of them used in Ohio. They do show up on the auction sites fairly often and prices vary wildly.

The TR-44C version is MUCH more rare. I know of only three, including mine. Mine came with evidence that it was used at an Austrian embassy in Cairo, Egypt. It is on almost every evening. Will try to post some pics to the files section next week. Sindre had some on his and JM Cherry's web site but Sindre's new site doesn't yet have a pic of it, or didn't at last check a few weeks ago.

I have never seen a T-4B reciter, which is essentially the transmitter part of the TR-44B, but I suspect it does not have the speaker/grill like it's counterpart in the TR-44B. Of course I could be wrong on that assumption. I know the earlier T-4 Reciter had no speaker/grill. As far as I know there was no TR-44 Comm station predating the TR-44B, although it is not uncommon to see an R-4 or R-4A and T-4 Reciter mounted in a CA-1 stacking cabinet.

I'm doing all his from memory – hope it's mostly correct!

12618. RE: [DrakeRadio] Re: Okay, so how rare are they?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-15 14:38:20 UTC
From: wayne.smith
Topic: 12572 Message: 12618

Great photos. Seems mine may be just stacked units.

I wish there was a comprehensive serial number database so that the SN's could be referenced. My unit has RCV SN 25952 and the TX is 27404.

Other than the RCVR MODE knob not original, the rig is in great shape. No corrosion on the chassis as far as I can tell. There is a slight hum in the audio from the PS. Have not put it on the air. Need to do that.

Thanks!

Wayne

Wayne:

There is a pic of a TR-44C here:

http://www.mods.dk/picture.php?brandid=14
<http://www.mods.dk/picture.php?brandid=14&model=tr-44c> &model=tr-44c

It doesn’t show the short cables, or tx xtal deck/door but you can see the TR-44C label and the T-4C reciter/speaker.

Good morning everyone!

Sindre – good to hear from you! Great info indeed and thanks for the correction on the T-4B speaker. I wondered about that – I remember seeing ads for the T-4B reciter when I was a kid but have not seen one in a long time. Good info on the TR-44 too.

Wayne – if there is a metal tag on the (left?) side that is printed with TR-44C, then it’s real. A “standard” TR-44C would have the RV-4C-like speaker and grill where the T-4XC VFO is and a 10 position “VFO” xtal switch bottom right corner as you face it, and the xtal door with 10 xtal sockets on the right side. The tx part is actually a T-4C Reciter. But as

Sindre has stated, Drake made special units, at least in the B version, that included a full tx and rx with both VFO’s. The metal tag (about 3” square) would be the best indicator.

Does it have short (6-8” long) connecting cables between tx and rx?

You all have my attention now! So is the "TR-44C" I have real? or is it just stacked with the CA1 cabinet. Bought off eBay a couple years ago and the seller sold it as a TR-44C.

Thanks!

Wayne

Subject: Re: [DrakeRadio] Re: Okay, so how rare are they?

Hi everybody,

Peter VE3AX/7 explains the differencies between the TR-44, TR-44B and TR-44C very well !
There was actually a TR-44 predating the more common TR-44B, but it used the T-4 reciter without any speaker grill as explained. The label says TR-44!
I have never seen any T-4 with the speaker grill, and I have never seen any T-4B without the grill either.

The TR-44C is probably the most rare of the three versions mentioned above. I have one myself with the metal modeltype label on the side.
All my TR-44 versions come from Sweden. The Swedish Ministry of Foreign Affairs used them on all of their embassies around the world. The most common were the TR-44B in conjuntion with teletype equipment made by TeleTrading in Denmark. These units were housed in cabinets of the same size as the 4-line by the way. Looks very nice indeed.
They got only one TR-44C from Drake, but that one was never put into service.

Drake delivered different setups for Sweden on demand: a few TR-44B's but with the T-4XB transmitter; so the TR-44B version from Drake with the T-4XB and R-4B did come from the factory in limited quantity. And at the embassy in Moscow Sweden had a special TR-44B with the SPR-4 receiver instead of the R-4B.
I have all units in my collection thanks to a very good contact that I had in the department of state in Stockholm.

I'm going to present all the equipment at The Virtual Drake Museum. I have not had much time lately to work with that one by the way. But that will change to the better for me. I'm ending my job as editor of The Norwegian Hamradio Magazine issued by NRRL by the end of May. I'm going to spend a lot more time working with the museumsite after that.

Have a T4x sn#12330, Have seen NO mods. Have cleaned all pots and switches,went thru all the tubes .The rigs chassis is ok,some pitting ,as normal,front panel, as new,dial and vfo clear and smooth,all knobs are fine. Cabinet is good,origional,no dents.NO SMOKE. Put on bench,found no idle current,while testing. Have another working transmitter,so will sell this one. Should be a easy fix.
asking 150.00 split shipping. Please get back off line.
thanks
dale wt4t

12622. TR-7 Dial question

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-15 16:32:13 UTC
From: Gary Woods
Topic: 12622 Message: 12622

Well, everything is playing well with the digital jumper card in place, but I noticed that the analog dial disk that reads 100KHz increments is out of sync, I.e. when I hit bottom mechanically (gently...) the radio is a bit below 3500 on 80 meters, but the dial is reading about +150KHz. It goes quite above the top end before running out of travel. Everything is working smoothly, so I'm resisting the temptation to pull the PTO/dial assembly out. It doesn't look like the disk can be slipped on its shaft; at least pushing cautiously on the rim didn't do anything but make the associated gear try to turn. Is there an easier way before I muck it up?

Gary -

There is a flat metal lever top right of the gearbox that when pushed to the left disengages the
dial from the gear train. Set to known frequency, then push lever and turn dial until correct.

12624. TR-4Cw PA Neutralization

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-15 16:57:20 UTC
From: slowcountry1
Topic: 12624 Message: 12624

Garey brought up Neutralization on one of my earlier posts when I mentioned that I had 200 watts output on 10M. Today, I went through the neutralization process. I neutralized the PA at 29.0MHz as the manual states and was able to quickly adjust the C-76 capacitor for a dip in plate current coinciding with maximum output. 40 meters, 20 meters, 15 meters all dip at maximum output; 80 meters and 28.400 MHz, maximum output occurs above the dip in plate current.

The following output power and plate current readings were found after neutralization;

3.850 500ma plate current 210 watts output. Plate current dip at 480-490ma.

7.225 500ma plate current 210 watts output. Plate current dip and max power equal.

14.225 500ma plate current 205 watts output. Plat current dip and max power equal.

21.300 475ma plate current 200 watts output. Plate current dip and max power equal.

28.400 500ma plate current 160 watts output. Plate current dip around 450ma = 140 watts output.

29.000 450ma plate current 145 watts output. Plate current dip and max power equal

The rig has 3 Sylvania 6JB6 tubes installed. I am using an MFJ oil filled 50ohm resistive dummy load. Rig was left turned on for 2 hours prior to neutralization. C-76 is meshed just a tad over half way.

I really don't understand obtaining a neutralization at 29MHz but having it off on 28.400. Is the sweet spot narrow enough here that I just missed it? Is the neutralization close enough to be satisfactory or should I attempt to get 28.4 and 29.0 in the same area?

Thanks,

Doug Coffman

Topic: 12624 Message: 12625

Doug -

Those readings look a lot more reasonable. The times I have seen 'variable' neutralization, it's
been with mixed PA tubebrands. Since that doesn't seem to be the case here... To be honest, I
don't think I've ever done that thorough a job of checking neutralization! If it was just 10M,
I'dguess that you weren't _exactly_ on the spot. But beingoff on 80M doesn't fit that scenario.

If you are in an experimenting mood, you might try an alternate method of neutralization. One other
way is to remove Screen voltage from the PA stage, then key while monitoring with a receiver and
adjust the neutralization capacitor, then recheck on additional bands.

From a practical standpoint, I doubt if your current situation would cause trouble, just dip the
Plate current last when tuning up.

Let us know what you find!!

From: Sindre Torp
Topic: 12572 Message: 12627

I have to come up with a correction to myself regarding the special TR-44B I mentioned used at the Swedish embassy in Moscow:
It is actually a special version of the TR-44C! It consist of the T-4C and the SPR-4 receiver delivered by Drake on special order from Sweden. I took a closer look at my different TR-44 versions this afternoon.

I have total three T-4C's:
one in the standard TR-44C, one in the unit mentioned above and a single stand-alone T-4C transmitter.

The serial numbers on my T-4C's are: 0532, 0547 and 0576.
I have no further info about the serial numbers of the T-4C's, or how many that actually were made.
But it seems to me that the serial numbers of the T-4, T-4B and T-4C are connected in the same number-row, in the same way like for example the TR-4, TR-4C, TR-4CW, TR-4CW/RIT.

My T-4's serial numbers are: 0009, 0103 and 0127
My T-4B's serial numbers are: 0308G, 0387B, 0459B and 0497B
and again the T-4C's: 0532, 0547 and 0576.

The serial numbers indicate how many that were made. Interesting, don't you think!?

Subject: Re: [DrakeRadio] Re: Okay, so how rare are they?

Hi everybody,

Peter VE3AX/7 explains the differencies between the TR-44, TR-44B and TR-44C very well !
There was actually a TR-44 predating the more common TR-44B, but it used the T-4 reciter without any speaker grill as explained. The label says TR-44!
I have never seen any T-4 with the speaker grill, and I have never seen any T-4B without the grill either.

The TR-44C is probably the most rare of the three versions mentioned above. I have one myself with the metal modeltype label on the side.
All my TR-44 versions come from Sweden. The Swedish Ministry of Foreign Affairs used them on all of their embassies around the world. The most common were the TR-44B in conjuntion with teletype equipment made by TeleTrading in Denmark. These units were housed in cabinets of the same size as the 4-line by the way. Looks very nice indeed.
They got only one TR-44C from Drake, but that one was never put into service.

Drake delivered different setups for Sweden on demand: a few TR-44B's but with the T-4XB transmitter; so the TR-44B version from Drake with the T-4XB and R-4B did come from the factory in limited quantity. And at the embassy in Moscow Sweden had a special TR-44B with the SPR-4 receiver instead of the R-4B.
I have all units in my collection thanks to a very good contact that I had in the department of state in Stockholm.

I'm going to present all the equipment at The Virtual Drake Museum. I have not had much time lately to work with that one by the way. But that will change to the better for me. I'm ending my job as editor of The Norwegian Hamradio Magazine issued by NRRL by the end of May. I'm going to spend a lot more time working with the museumsite after that.

Subject: Re: [DrakeRadio] Re: Okay, so how rare are they?

Steve:

The stacked set that was on epay was simply a standard R-4B and T-4XB in a CA-1 Stacking Cabinet. You remove the top cabinet of the R-4B leaving the bottom in place, mount the CA-1 in place of the receiver cabinet top, remove the bottom of the transmitter and mount the tx on top of the CA-1. Result is what you saw. You still need to add an external speaker and of course an AC-4. Typically the tx/rx connecting cables are the standard ~3 foot cables you see with any B/C line.

The TR-44B was a special version of the above assembly that eliminated the transmitter's VFO and replaced it with a speaker/grill that is almost identical to what you see in an RV-4 or RV-4C. It uses a special transmitter cabinet top that has a snap out cover on the right side (as you face the unit) that has (I believe – not at home to check) 10 spare 5 Mhz VFO xtal positions. These are switched from the front panel in the same place where the 4 position auxiliary dial range switch is on the T-4XB. A switch on the front panel selects the RCV VFO or the Xtals for tx frequency. A pilot light indicates non-R4B VFO control.

There is an RCA jack mounted in one of the spare holes on the back of the transmitter for connecting the speaker cable from the receiver. The tx/rx connecting cables are all short – about 6 or 8" long only – no need for long ones of course as they are always together.

There is a metal label on the side that states this is a TR-44B Communications Station. See Bob, VE3UK's, pics of a real TR-44B in the files section of this group.

The TR-44B was used for many government agencies and civil defense units, as I understand, but I am sure there are others on here that can shed further or more accurate history. There seemed to be a lot of them used in Ohio. They do show up on the auction sites fairly often and prices vary wildly.

The TR-44C version is MUCH more rare. I know of only three, including mine. Mine came with evidence that it was used at an Austrian embassy in Cairo, Egypt. It is on almost every evening. Will try to post some pics to the files section next week. Sindre had some on his

and JM Cherry’s web site but Sindre’s new site doesn’t yet have a pic of it, or didn’t at last check a few weeks ago.

I have never seen a T-4B reciter, which is essentially the transmitter part of the TR-44B, but I suspect it does not have the speaker/grill like it’s counterpart in the TR-44B. Of course I could be wrong on that assumption. I know the earlier T-4 Reciter had no speaker/grill. As far as I know there was no TR-44 Comm station predating the TR-44B, although it is not uncommon to see an R-4 or R-4A and T-4 Reciter mounted in a CA-1 stacking cabinet.

I’m doing all his from memory – hope it’s mostly correct!

Garey,

At some point, in the near future, I will go through it again and see if I can find a sweet spot. As long as it does not cause an issue I will use it as is, for now.

I opened up the covers on the L4 and L4-PS this morning just to make sure everything was in order. I replaced the air box seal as it was vaporized. The power switch / CW/SSB switch was replaced by the previous owner; I found that the wires were soldered but just not to the switch. They were through the contact holes and soldered they just didn't heat the tabs to flow the solder. I corrected that and fired the old girl up. I was pleasantly surprised that it tuned right up without tube flashes or component arcing. The tubes are date code 1968 3-400's.

The power supply transformer settings are for 230VAC however; my line voltage is a consistent 245VAC. The CW voltage shows 2100 volts and the SSB voltage shows a tad shy of 3000 volts. Tuned up as prescribed, in SSB operation, a whistle or voice peaks on my peak reading meter indicate almost 1300 watts output. This is great for an old set of tubes and I'm sure that's about 200 to 300 watts more that it was designed for. The increased line voltage is behind the increased output.

I went back through some old information that Steve Katz, WB2WIK, sent me back in 2004 regarding questions I had on this amplifier. I need to verify that the increased line voltage hasn't increased the filament voltage out of its safe range and I need to verify the high voltage readings. Other than that, all seems good.

All in all, everything is working great for the time being. Your CD's and helpful information has been indispensable returning my gear back to service. Thanks again,

Doug Coffman

Doug -

Cool! Yep, that is a rugged amplifier. I would be concerned about the filament voltage on the
3-400Zs. A bucking transformer on either the 240 input or just on the filament/bias transformer
would be a good idea. The filament needs to be +/- 5%, closer the better. The increased high
voltage isn't really a problem, UNLESS it gets too close to the capacitor ratings.

Hi group, I am having problems with a TR4C with a very low power output on 10 mtrs, also 15 is not that great but at least is 50W on 10 what I get is roughly 5W.
Also the reception on this band is quite low in comparison to 40, 20 or 80 where power is almost 200W
I aligned it as per manual but no good results on 10.
Tubes are brand new and neutralization has been done on 15M
Any help or advice is welcome.

Just thought I'd let you all know that I followed Steve's suggestion about cleaning up the connectors on the DR7 module and it did indeed take care of the problem. I had the rig on for over an hour with no change of frequency (other than the normal amount of drift you'd expect from a rig of that age) and the UP and DOWN buttons are back to working in 500 kHz increments, as they should.

A little note that you might find interesting: I have an original factory printed service manual for the TR7 (in the blue Drake binder) and the instructions on how to remove the DR7 board neglect to mention that you have to remove a screw before you can pull the board. In fact, there is photograph included which demonstrates the use of a board puller shows the operation being done with the screw still in place! Fortunately, I decided that it shouldn't take that much effort and removed the screw before the PCB cracked.

73,

Carl, KJ6BSO

Okay, thank you for your advice. I'll try the fix this weekend and get back to the group to let you know how it turns out.

73,

Carl, KJ6BSO

My TR7 did this to me a month ago - like many others here I found that cleaning the pins and sockets on the cards located under the DR7 board fixed the problem. You'll need lots of patience to get the DR7 out, take off the cover over the cards that are under it and remove each card one at a time. Spray the Molex pins with De-Oxit, wipe clean, spray a tiny bit of De-Oxit into the socket the board mounts to, give it some time to evaporate, and then reinstall the card. I did the whole procedure over several nights but I am really slow.

kj6bso@... writes:

Hello, all--

My TR-7 recently developed a glitch: It works properly when I first turn it on but after about ten minutes, the tuned frequency will drop exactly 500 kHz. Once this has happened, pressing either the "UP" or "DOWN" keys, changes the frequency in 1 MHz increments rather than the normal 500 kHz step, although the LED display will flash the 500 kHz increment for a fraction of

a second on the way past. A quick off-on power cycle doesn't eliminate the problem; letting it sit overnight does, which leads me to believe it's a thermal issue. I have not yet had the opportunity to test how long it needs to be powered down before it returns to normal operation.

Any ideas on why this is happening and how I might go about fixing it?

73,

Carl, KJ6BSO

Garey,

Prior to measuring the filament voltage on the 3-400's, I have done some research. The following site http://www.w8ji.com/filament_voltage_life.htm indicates a test method for monitoring the voltages. The test procedure employs Series components; 220 µH RF chokes and Shunt component is .1 µF capacitor. Looking at the picture it looks like two resistors with a shunt capacitor, I do not see any chokes in this setup.

What would be the best way to check the filament voltage on the L-4. I'm assuming I need to check it at power up, after the filaments have had time to warm up and then during full power transmission.

What are your recommendations here?

Thanks,

Doug Coffman

12634. L-4 amplifier add standby

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-16 14:07:47 UTC
From: slowcountry1
Topic: 12634 Message: 12634

The L-4 does not have a provision for "Standby" other than turning the power off to the amplifier. I turn the power on and off via the 220v breaker at the box to prevent damage to the power switch. Is there a method to add "standby" to the L-4?

Thanks,

Doug Coffman

If you have it on it's own 240V drop, adequately sized, I wouldn't worry too much about under load
measurements. You say your drop is a little high, so I'd set it just a bit above 5.00Vassuming your

power company is doing its job.

The 'correct' way to do it is to monitor the 240V over a few days with a recording voltmeter,
(Dranetz, etc.,) average the reading, and assuming it stays within +/- 5% or less, set the filament
voltage to the nominal value for 5.00V.

From a practical standpoint, check the 240V at minand max load times, an hour or two before dinner
time on a hot day, 4:00 o'clock in the morning, etc. and average that out.

I don't see any need to go through all the hassle to measure filament voltage at the tube under
load. Makes more sense to relate the 5.00V to the primary voltage and then measure the primary
under load.

Doug -

I just readJI's page. Seems well researched, and makes sense.

The 'True RMS' meter is probably not that important IF you have clean sine wave power. If you got
it, certainly useit, but I wouldn't buy a meter just for this!

Those ARE RF chokes in the photo, and that is a reasonable way to measure under load. I still think
percentage variation of the primary voltage is going to be close enough.

All in all, sounds like much ado over nothing. Set the voltagea little high, no load, and confirm it
doesn't dropbelow recommended voltage under worst case line variations.

It applies to ALL Drake PTOs. Originally the lead screw/tuning slug was grounded through the front
ball bearing, and the follower lying against the rider bar at the top. The bearing path began to
show problemswhen the original grease hardened and became 'crunchy', ('jittery frequency when
tuning',) and the riderbar was compromised by oiling and dirt.

The braid makes a nice, steady ground connection and resolves those problems

Doug -

The L-4B accomplishes this by replacing the VOX control with one having a 'push-pull' power switch.
The switch is used to break the 30 VDC relay control line.

Many guitar controls have push-pull power switches on them. No voltage or current concerns.

Hi Doug,
I have a L4B, and that has the ALC adjusting pot and switch, By pushing it in or out, it puts the amp on standby or operate.
Not sure for the L4, but possibly it could be added fairly easily.

The L4 ALC control is on the rear panel. There is no standby switch on the L4 amplifier although an external one can be easily added. Several companies make PTT/standby switches designed to interface vintage amplifiers with the newer rigs that have been designed to handle only low voltage and low current relays. These external interfaces often have a standby switch on them.

It is best to save the on/off switch by using it as little as possible. An external on/off switch is preferred. And in spite of what many companies claim, the 3-500Z is not an instant on tube.

Enjoy those Drakes.

I have a small aluminum minibox with a small toggle switch to open the PTT relay line to the amp. No need to drill any holes. I use this on my L4 only as my L4B has the built in standby switch.

Gary,

So all they are doing is breaking the connection between the VOX input to the amp and the transceiver? I was going to put a toggle switch inline between the AC4 VOX connector and the L4 VOX connector but was afraid something else needed to be disabled. Will a toggle switch suffice for this?

Thanks,

Doug Coffman

Hey Mike....I LOVE the Amp-Keyer that I bought from you. I no longer have to lay awake nights wondering if I'm destroying the small keying relay in whatever rig I'm using to feed the amp. Been thinking of running the radio keying inputs (3 or 4) through a three or four position switch to select which rig is keying the amp instead of having to plug & unplug connectors. Also looking at doing likewise with the ALC line back to the respective rigs...for those that have an ALC feedback capability. For those rigs that don't, I just make sure I don't over-drive the amp with them. Do you see any difficulty in doing this? Please advise.

Doug-

Yes, that's all you need. I was thinking earlier that the L-4 had a front panel VOX control, just
no switch. But Evan is correct, the VOX control is on the rear panel. Not too convenient!

The VOX line only has about 30VDC on it, and takesabout 60 mA to closethe relay. So anytoggle
switch should handle it.

Thanks, Garey,
I thought I'd mount the rotary switches in an aluminum project box, using RCA jacks in and out for both keying and ALC...and sheilded wire of course. Should be a fun project. Otherwise I could probably re-dedicate part of my patch panel for that purpose also. Thanks again.

Date: 2013-03-16 20:40:59 UTC
From: DANIEL
Topic: 12292 Message: 12650

Hello group:

I´m working in restoring a tr7. The pcb power supply is not working but I replaced with +24 and -5 vcc external power supply.

The display show me 51 (fixed) and the four digits (eg 110 .0) with decimal point.

I can change the frequency using vfo and receive some signal (internal xtal calibrator) but the up and down buttom dont work and the bands seems to be out of frequency (3mhz. down).

I cleaned all related connectors with dr7.

I checked the input bcd signals to digital control board from the band switch and is ok.

The output from control pcb to dr7 dont match with the correct data to change band (N number) so I suspect in a bad function in this pcb.

I would appreciate any help.

Bernie,
Maybe even an old rotary antenna switch, would work. You'd likely want to change out the SO-239's, for RCA's, or something better, but a decent rotary antenna switch, like an old B&W or Heath, would do the trick.
See now, you got me started thinking, now my feeble old brain is hurting!

Garey,
It sure is nice to have a group of adults, who don't get their underwear in a bunch, over small errors, off topic subjects, and other things easily remedied, by the DELETE button, like other reflectors are populated with.

Topic: 12654 Message: 12654

All, sorry for the plethora of posts; I mistakenly thought I had all of the bugs worked out of my system but I was proven wrong.

Last evening the rig's receive and transmit decided not to track with one another. The VFO, once the unit was at stable temperature, very seldom if ever drifts. Now the transmit and receive are jumping around; when they jump or drift, they do not jump together. I did the PTO grounding this morning; this did not have any effect.

I have a small computer fan mounted on the back of the rig to push air into the PA and I have a larger fan on top of the PA sucking the air out. This is how I had it set up when I used to run it on a regular basis; frequency drift was very very minimal with this setup.

The setup is as follows; TR-4Cw, RV-4C and L-4. This issue occurs with the RV-4C controlling receive or turned off. This does not change the drift and separation of transmit and receive. I have the pieces of equipment on my desk side by each with about 2" of separation between them.

Any thoughts on where to start looking?

>
> I opened up the covers on the L4 and L4-PS this morning just to make sure everything was in order. I replaced the air box seal as it was vaporized. The power switch / CW/SSB switch was replaced by the previous owner; I found that the wires were soldered but just not to the switch. They were through the contact holes and soldered they just didn't heat the tabs to flow the solder. I corrected that and fired the old girl up. I was pleasantly surprised that it tuned right up without tube flashes or component arcing. The tubes are date code 1968 3-400's.
>
> The power supply transformer settings are for 230VAC however; my line voltage is a consistent 245VAC. The CW voltage shows 2100 volts and the SSB voltage shows a tad shy of 3000 volts. Tuned up as prescribed, in SSB operation, a whistle or voice peaks on my peak reading meter indicate almost 1300 watts output. This is great for an old set of tubes and I'm sure that's about 200 to 300 watts more that it was designed for. The increased line voltage is behind the increased output.
>
> I went back through some old information that Steve Katz, WB2WIK, sent me back in 2004

regarding questions I had on this amplifier. I need to verify that the increased line voltage hasn't increased the filament voltage out of its safe range and I need to verify the high voltage readings. Other than that, all seems good.
>
> All in all, everything is working great for the time being. Your CD's and helpful information has been indispensable returning my gear back to service. Thanks again,

Garey,

I have found that after loading for maximum output, If I re-peak the tune control for maximum plate amps, and then re-dip the grid, maximum power output occurs at the dip on 28.400MHz.

Do you see any problem with this extra step? Will this cause distortion issues>

Thanks,

Doug Coffman

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

Doug -

First of all, get rid of the fan blowing IN. All this does is blow hot air inside theradio, heating
and cooling with transmit and receive conditions. Get the hot air OUT and AWAY from the radio.

Did you do the grounding braid in theRV-4C? None ofthe oscillators 'should' be changing from
transmit to receive. Obviously if the RV-4C is controlling receive, it can be on a different
frequency than the TR-4Cw.

I would say....

1. Measure the regulated +150 in transmit and receive, ensure that it stays 'lit' and the voltage
stays still!

2. Measure the voltage at each of the PTO's to ensure that voltagestays constant.

3. DeoxIT the slide switch on the left side.

4. Replace U1, MC14016BCP. Any of the CMOS *4016* ICs will do.

Garey,

I will definatly check those points. To clarify, if the rig is controlling both transmit and receive, remote VFO off, this condition occurs. If I use the remote VFO to control both the same problem exists. Transmit and receive drift but not together. Transmit frequency may change while receive frequency stays stable and sometimes it works the other way.

I had not grounded the the PTO on the RV-4C until just a few minutes ago. I will remove the fan blowing into the PA cage.

Thanks again,

Doug

OK. The fact that it's the same with either one eliminates the PTOs as a source. The other two
oscillators that determine frequency on transmit and receiveare both crystal controlled, and should
NOT move. Does the frequency 'drift' or does it 'jump'.?

I'm leaning more and more to the MC14016 IC. You can disconnect the RIT line from the side of the
PTO, just behind the gearbox. The dial calibration will be off a bit, but see if that 'fixes' the
instability.

Garey,

The frequency jumps pretty quickly. RIT line? Is this present on the TR-4Cw? Mine does not have rit.

To clarify: the fan is needed, just _reverse_ it so that it blows outward, that is so sucks the hot air from around the finals. It will also cause cool air to flow in around the chassis. While most of the heat is from the final tubes there is some from elsewhere and reversing the fan will help cool everything.

Doug -

Sorry..... Wrong radio! :-)

Does it do this on 80/20, other bands, or both?

Ifyou have an external receiver that covers 9 MHz you can listen to the Carrier Osc.

Clean contacts of K2, back wall near left side looking from front. Pull business card or paper,
soaked with DeoxIT, through N.O. and N.C. contacts.

12664. Trojan Horse found on myteaquinn emails

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-18 16:04:19 UTC
From: Terrell Hamilton
Topic: 12664 Message: 12664

Hi, all - my ESET security program just quarantined the recent email on the DrakeRadio website. The poster has sent emails at least once before, and I seem to remember that some problem was connected with my last reception of his mailing.

I'm not sure if this means anything dangerous to us, but thought I'd pass it on.

Probably was a trigger word your security program didn't like. I just 'took' his post apart and there are no hidden nasties in it.

Security programs can be funny...For instance, a few years ago, many households were very upset because their security programs wouldn't let a Disney site and messages come through, due to a 'trigger' word in the content...(Forget now what it was, but Disney changed the content so as to not get thrown into a quarantine directory!)

Thanks for the head's up though...one can never be too cautious!

FWIW, I saw a note from the same poster in a Nikon group that I read which had received the same spam at the same time. He apologized and indicated that he was aware of the problem and had taken measures.

My ISP is also deleting all his posts, Terry. I have seen replies to him, but not his originals.

I had a similar problem with Mouser Electronics years ago. Some strange word in their emails triggered it, and it took us weeks to find that one, so I don't ask him to look unless I really need the posts.

There was at least one recent spam email from that account posted across multiple groups, containing a malicious URL of the type that we have been seeing a lot of lately. That's probably what got him flagged. As I mentioned, he posted in a another group that he was aware and taking measures.

12670. R-4A S-meter linearity

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-18 20:24:19 UTC
From: Al
Topic: 12670 Message: 12670

I recently picked up and re-aligned an R-4A, and I have a question about the accuracy of the S-meter. If I adjust the sensitivity control and bias for an indication of S-9 with about 100 microvolts at the antenna, and then go up 10 dB on my signal generator, it just goes up to a little more than the +5 mark, and then if I increase the signal level another 10 dB, it goes up to about the +10 indication (should be +20 over 9 at this point), and so on up to about +30 dB on the meter. Then it starts increasing more rapidly with increased signal level, so that with a 60 dB signal increase from the S-9 point, it does read close to +60 on the meter. It's just in between (about +10 to about +40) it doesn't seem to read very accurately.
I was just wondering if this is normal for these radios. I tried all different setting of the S-meter sensitivity and bias pots, but they don't make a huge difference.

If I listen to strong signals on the air, most of them read between S-7 and 20 over. Almost never do any signals read much above +20 over 9.

I suppose my signal generator could have some leakage at some signal levels. (I'm using a Wavetek 3001, which has been calibrated a couple
years ago or so.)

Any thoughts would be appreciated.

Al, WA2S

Al -

I've never paid too much attention to S-meters since there is no real standard, and they are
completely dependent on the AVC characteristics of the receiver.

I have looked at ONE R-4B out of curiosity one day, and was surprised how close it was, at least at
S9 +/- 30 dB. First S9 is 50 uV, not 100 uV. There's confusion about this because Collins calibrates their S-Meters for 50 uV at S9, but they specify 100 uV from the generator, AND a 50 ohm
termination at the receiver end of the cable. So the 100 uV is 'split' between the 50 ohm resistor
and the receiver input, which is _nominally_ 50 ohms. This is probably more consistent because it
properly terminates the coax but causes confusion.

S-Units are specified as 5 dB by Drake, 6 dB by some others. Anyway, the newly aligned R-4B in
question showed S9 at 50 uV, and was 'accurate' when increased 30 dB or decreasedto S3. Obviously
the meter scale and pointer don't contribute much to accuracy, but ...

Remember the first mark is S1, not S0.

I think the book for the R4B states that S-9 is _about_
30 uV. I checked mine with a calibrated signal generator, I
think on 40 meters, and found it very close. I don't
remember what I found on other levels. As Garrey says there
is no real standard, manufacturers have used values from
about 25 uV to 100 uV and many receivers have an adjustment
so you can make the meter read whatever you want. The
calibration of the meter will depend on the AVC which will
be all over the place depending on tube gain, etc. Mainly
an S-Meter is to give rough comparisons of signal strength
and to aid tuning. It is typical for AVC systems to
compress a bit at higher levels so often meters will read
fairly accurately up to perhaps S-9 +10db and increasingly
compressed above that. It also depends on what exactly the
meter is reading. Some read AVC voltage, some carrier level
at the detector, some cathode current of one or more tubes,
all subject to different variations. However, if an S-meter
is very far off in its indications it can mean that
something has gone wrong but that will usually show up in
some other, more definite way.

Richard -

Yeah, I've been setting mine for S9 = 50 uV for so long I'd forgotten. So I'm about one S unit high.

It's more in line with Collins, Kenwood, and I think most others. Again, ALL relative. Now if you
have an Empire NF-105 with calibrated antennas ... :-)

My Collins R-388 has arbitrary calibrations in db above
the AVC threshold. That is about 2.5 micro-volts on this
particular receiver. The calibrations are actually not far
off. Of course, I never hear any contesters reporting
anything except 599. BTW how can you have 599 for phone?

12676. Re: [DrakeRadio] Bringing my TR-4 back to life... usable but not completely fixed - LONG

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-19 00:08:13 UTC
From: Mark Pilant
Topic: 11909 Message: 12676

OK. I finally managed to get on our local 10m net last night and give the TR-4 a try. I got good signal reports, so I'm almost there. I'll declare it working, but I'll note the remaining problems in another message.

Where I started...

I picked up the TR-4 on this list. It was described as:

"Bought at a flea and I didn't look close enough. Appears something was spilt on top and not cleaned up inside.
Cabinet shell looks good except for a deep scratch and dent on front edge; bottom of shell is free of dents bit some scuffs, that appears to be retouched by someone.
The front panel is clean, knobs look good, tuning knob needs inlay.
Meters and pilot lights all ok.
Copper corrosion.
Every control sounds dirty.
A quick test found no receiver, cannot copy it's own 100 Kc calibrator.and because of contamination transmitter not checked.
I didn't want to do any more damage."

I put the pictures of the rig here:

http://www.n1vqw.net/tr4rebuild/

After cleaning it all up, I applied power (using the AC-4 I recently rebuilt) to see what was up. I figured since power had already been applied I wasn't likely to do too much more damage.

As the seller indicated... nothing.

The first thing I did was give it a fairly serious cleaning using cotton swabs and distilled water. Even then, I had to be careful of the tube markings and some on the Drake inking on the PTO and chassis.

The first problems I found were:
o The T/R switch was broken. So I drilled out the rivets and replace the switch I got locally. I used pan head screws to minimize the interference with the covers. In replacing the switch I discovered the RFC (750 uHy, 500 mA) was bad. I have not yet replaced it, but it is on the list.
o The original K1 relay had had a hacked in replacement. I ripped it out and replaced it with the available relay board and a new relay from Mouser.
o The #12 lamp and socket were also long gone.

After all of this, I was starting to see signs of life when I applied
a 7.200 MHz signal to the antenna jack (from my HP 8640B). I was
seeing deflection of the S-meter with the signal applied.

I was also getting AC hum in the speaker.

Garey suggested a number of things:
o Check all the DC voltages; in particular the -60V bus.
o Make sure the S-Meter was zeroed.

All of the voltages were OK. All of the tubes tested OK on my TV-7/B.
And I completely forgot about the zero pot. Sheepish grin :-)

Garey then suggested:
o Double checking the T/R switch on the side was in the TCVR
position.
o Check the Cathode, Screen, and Plate of the audio output
tube (6AQ5) and other tubes "feeding it".
o Verify all the tube plates have voltage.

The T/R switch was in the correct position, and the plate voltages
were OK, but some of the other voltages on the 6AQ5 were very strange.

At this point I decided to do a complete voltage check; and Garey
agreed it would be a good idea.

In the process of doing the voltage check, I discovered a number of
other "modifications":
o The socket for V5, the calibration oscillator, had *real*
loose pins. I replaced it with one of the same kind from
my junk box.
o There was a relay on the chassis shield by V5 which was only
partly wired up. This was removed.
o There was a loose wire (white/gray stripe) in the vicinity
of the MIC jack which was "flying in the breeze". This
turned out to be the PTT line.
o The original MIC jack had been replaced with a 1/4" jack.
o There was a cut wire near the power plug on the back of the
chassis. (It was the VOX relay line.) Fortunately, the
remainder of the wire was on the power plug and with my
handy "wire stretcher" I was able to hook it back up.

After fixing all of these problems, I was able to do a complete
voltage check. While most of the voltages were within 10% of what
they were supposed to be, other were *way* out.

So, now for the single thing which helped the most...

Since I had cleaned the chassis, and the switch contacts (with Deoxit)
I get to thinking the tube sockets and tube pins might also benefit.
BOY!!! was I right.

After a thorough cleaning, I was going to do a voltage check, but
instead just fired it up. It happened to be on 40m, and I started

to hear signals. (The rig was connected to my R-7 antenna.) Not only could I hear signals, but the hum was gone, and the volume control actually worked. (It didn't originally work.)

After all of this, I did a thorough alignment and was impressed with how close things really were. Some adjustments were a little "touchy" but all-in-all, not too bad.

I've spent the past couple of weeks just cruising the various bands, and bringing and RV-4C back to life as well. Since I was able to get on the air this past Sunday I figured it was time to wrap things up with a description of what I did.

A big thank you to all the folks on the list, and to Garey's CDs. The high resolution pictured really helped.

While my TR-4 is now usable, there are still some remaining minor problems to be addressed:
o Sometimes, when switching from X-CW to SSB after tuning up, the receiver is still muted. However, switching back to X-CW and then to SSB again seems to "fix" the problem.
o While listing on the 10m net Sunday, I was hearing almost a low frequency "pulse" type noise. I'd put it about 10 to 20 Hz. It was not AC hum. It is less on the lower frequency bands, but still there. It is also more pronounced the higher the audio gain.
o The S-Meter zeroing doesn't seem to "hold". When switching around the bands, the zeroing of the S-Meter will have to adjusted. BTW, I'll switch over to my dummy load before adjusting just to eliminate as many spurious signals as possible.
o There seems to be some audio "bleed-through" in my head phones when transmitting. (I'm using Kenwood HS-5 head phones.) When I transmit, I can definitely hear my audio in my ears.

All of these need to be fixed, but as I said, the rig is usable and it does transmit and receive well.

My first step is going to be to check through the archives to see if others have reported the same problems.

Now I need to rebuild my AC-3 and attend to my ailing TR-3 :-P

Mark -

Nice Write-up.....

1. Usually indicates dirty relay contacton the (RCVR K) contact. Make
sure the relay wiperisn't bent and that N.O. contact isn't bent up a bit.

2. Dunno... Hearing ionosphere shift close to MUF??

3. S-Meter 'drift' is usually a gassy tube. The S-Meter compares the
current drawn by V17 with the current through V11 and V15. V15 is
most suspect since the 12BA6 is prone to this, but could also be V11.
You can measure the cathode current of V15 over time and see if it
drifts with the S-Meter.

4. Did you do the IF Neutralization adjustment (Section L of the
Alignment)? It should take care of 'almost' all of that feedback.

12679. TR-4Cw S-Meter question

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-19 12:25:00 UTC
From: slowcountry1
Topic: 12679 Message: 12679

While resurrecting my TR-4Cw, one of the first things that I did was to put a dummy load directly at the antenna jack, rotate the RF gain slider fully CCW and adjust the S meter pot for 60db over 9 as indicated in the manual. With the RF gain slider full CW, with the dummy load in the same position, the S-Meter reads upscale at S4 or S5 instead of S1. With the power turned off on the rig, the S-meter will return fully to the left.

I fully understand that S-meters are subjective and I rarely concern myself with the readings; however I wanted to find out if this was an indication of a problem. I'm assuming this is not normal operation. Should I replace V-17 or what areas should I check?

Thanks,

Doug Coffman

Garey,

With the dummy load attached and the RF gain fully CW, I can adjust the Zero pot on the side and set to S1. When I rotate the RF gain fully CCW, it will only reach S9+30db.

I just re-read the manual. I confused the S meter adjustment with the Zero adjustment. With the S-meter at S1 I need to adjust R187 with RF gain fully CCW to obtain S9+60

Ignore the post, I totally confused two subjects and will adjust accordingly.

Thanks for all the info about S-meters, etc.
I only set the meter on mine for S-9 at 100 microvolts at first because that's how the service manual for my TS-830S tells you to do it (without a 50 ohm load at the antenna connector), if I am interpreting it correctly. That method seems to work OK for that radio, but not so good for an R-4A.

The way I have it now, it reads S-9 for even less than 30 microvolts, but it seems to read around where I like it when listening on the air. Checking it again with a signal generator, it doesn't seem to be quite as non-linear as I first thought, so I don't think there is a problem with the radio. (I did a re-alignment of the RF and IF sections since, so that might have helped.)

I guess it is mostly a relative thing, so probably the best thing to do is set it where you like it.

73,
Al

Kenwood may assume that the generator is calibrated for
open circuit voltage. Assuming it does and has 50 ohm
source impedance, and assuming the receiver presents a 50
ohm load, the voltage across the antenna terminal will be
half the indicated value or 50uV. Now, my Hewlett-Packard
606A reads the voltage across a _terminated_ output but my
General Radio 1001-A indicates the open circuit voltage and
must be halved for a terminated connection. If Kenwood
specifies what generator they used for the adjustment you

may be able to find out how its calibrated. AFAIK there is really no standard for S-9 although 50uV seems to be a sort of defacto standard. Older receivers used anything from 25 to 100 uV but also many older receivers could adjusted to read whatever you liked. It is common practice now to have antenna systems running at 50 ohms but in the past all sorts of impedances were used and most receivers had inputs of around 200 ohms. So, the actual voltage at the terminal could vary over quite a range for the same signal strength, hence the adjustable meter.

12685. SCSI cable needed

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-20 02:00:26 UTC
From: Jim Wiley
Topic: 12685 Message: 12685

Looking for a 50-pin to 50-pin male to male SCSI type cable at least 6 feet long, longer is OK. This would be the "old" style cable with 3 rows of pins in the connector, sometimes also known as a D-sub type connector (similar to a DB-25, but more pins). Standard density pin arrangement (specifically not high density) and nota ribbon cable as used inside a computer to connect hard drives and such. The connector body inside the shell is approximately 2 inches long, and about 3/8 inches (or a bit more) wide.

Application is for aantenna switch project I am working on.

Anyone out there happen to have such an item in their junk box? Sell or trade?

I don't know about the PTO bushing, but if you'll check www.2bradioparts.com , they have a very nice set of the blue filters with the white diffusers for about 8 bucks. One set will do 2 radios. I have ordered several sets for my TR4's. Very nice.

TR4-C rubber bushing per discussions was a piece of fuel line or vacuum hose as I recall. I am sure that someone will reply. As for the blue lenses, the other Drake list has a lot in archives, and perhaps this one does also....probably on both items. Carl wd8nhk

http://www.2bradioparts.com/page11.html for the blue filter material is probably the easiest.

I've heard that a short length of automotive vacuum hose will work for the bushing.

Good luck!

Garey,

Below are the checks and adjustments made. A fellow local ham directed me to listen to all of the oscillators and what to listen for; the only thing that appeared to be amiss were the band crystals. At this time, I do not know if the problem is solved but I have provided my findings for your review and comment.

TR-4Cw checks 03/19/2013

Frequency sliding while transmit, receive frequency quick jump
1. Measured 150VDC regulated power at pin 1 of V20 during receive and transmit over a 20 minute period.
a. Receive voltage +148.46VDC
b. Transmit voltage +148.23VDC
2. Measured +10.92VDC at the PTO
a. No change from transmit to receive
3. Clean open frame relay at back of radio with business card and DeOxit
a. Results caused a different audio tone when the contact was moved slightly
4. Burnished open frame relay contacts with 800grit wet dry paper with DeOxit

a. Slight burr appeared to be present
b. Results caused audio tone to stay stable when the contact was moved slightly
c. Receive frequency doesn't appear to jump or drift
Transmit frequency continues to "slide" while transmitting
1. Listened to 9Mhz oscillator while transmitting ☐ No change in tone
2. Listened to VFO frequency at 5.172.505MHz while transmitting on 28.325MHz ☐ No change in tone.
3. Listened to crystal frequencies 21.5, 35.5, 42.5, 43 and 43.6. Crystals 21.5 and 35.5 produced a constant tone while 42.5, 43 and 43.6 crystals oscillated in tone and signal strength. Transmit characteristics were the same.
a. All crystals, tone could not be found at specified frequency; had to tune receiver well below the specified frequency.
4. Performed Injection Crystal Oscillator Calibration using Fluke 289
a. Connected positive lead to T.P. and negative lead to chassis
i. 7MHz displayed a positive value, adjusted to -1.165 VDC
ii. 21MHz start value +1.386VDC adjusted to -.7507VDC
iii. 29MHz start value +2.187VDC adjusted to -.2770VDC
b. Listening to crystal oscillator now 21.5 and 35.5 produces tone directly on frequency ☐ Stable tone
c. Listening to 42.5 produces stable tone at 42.498
d. Listening to 43.0 produces stable tone at 42.998
e. Listening to 43.6 produces stable tone at 43.598
i. Tones produced are stable in both transmit and receive

Instruments used;
1. Fluke 289 True RMS DMM
2. Yaesu FT-847 to listen to oscillator frequencies

Results on transmit;
1. Unable to monitor transmit audio, no headphones
2. No local operators on frequency at this time. Will check when time permits.

I'm interested how you managed to change the oscillator voltages in 4.? I thought you had already done the alignment procedure?? Section 5-10?? Same question, how did you pull the frequency of the three 10M crystals?? Certainly this oscillator can be unstable if L1, 2 & 5 alignment is not done..... You can sacrifice some small stability for frequency accuracy as long as you don't have to move it too far...

I totally concur with Don! I have used Don's site for restoral of my Drake 2B/2BQ.

Just orded about $40 worth of parts to restore two (2) TR-4s, one of which is going to a bush pilot buddy of mine in Alaska, so it HAS to work!!

Great hard-to-find parts resource.

Garey,

I have not done an alignment; I do not have a VTVM or a 1 meg ohm probe to do an alignment with. I did align the 9MHz oscillator as described by adjusting C130 for the same pitch on USB and LSB. I did neutralize the PA, with a minor compromise on 28.400 as described in one of my other posts.

To change the oscillator voltages, I connected the positive lead to the test point connected to V1 and the negative lead to the chassis. I read the voltages described earlier and adjusted L1, L5 and L2 for maximum negative voltages. These voltages were all positive prior to adjustment. Prior to adjustment, listening to the crystal frequencies, the 10 crystals all had a warbling tone with increasing and decreasing intensity. After adjusting

the voltages, they all produced a stable tone and tone could be found close to the stated crystal frequency; previously they were well below the stated frequency.

As far as how did I pull the frequency of the 10M crystals; I have no Idea, all of the crystal frequencies came up in frequency when I adjusted the voltage measured to maximum negative voltage as directed in section 5-10 of the manual.

To check the 9MHz oscillator, frequency crystals and the VFO frequency, I attached a jumper to the HF jack on my FT-847 and laid the other end next to the item I wanted to listen to. I then set the frequency on the FT-847 so that a sharp tone was present, at or near strongest S Meter reading on the 847. I then began transmitting on the TR-4Cw to see if there was a change in pitch. After adjusting the voltages at L1,L2 and L5 the crystal tone produced, VFO tone produced and 9MHz oscillator tone produced were all constant in both transmit and receive.

After burnishing the open frame relay, receive frequency drift seems to have stopped jumping. I have not found anyone to talk to yet that can report on the transmit signal. Last night, it was sliding up and down while transmitting, it was reported to be a smooth slide up and down, not a sharp change. I do not know if it is solved; hopefully when some local folks get home from work this evening, I will be able to test this out.

Have I incorrectly measured the voltages and or oscillator frequencies?

Thanks,

Doug Coffman

Doug -

OK, my mistake. Yes, if those inductors are not tuned properly, the
BAND oscillator can be unstable. I must have this project confused
with another one, as I thought you had done the alignment.

You can do the alignment, you only need the VTVM for oscillating stages, and in the TR-4Cw the Grid of the BAND oscillator is at RF ground so is not confused by loading from any good hi-Z meter.

Your measurements are fine, and sounds like you have K2 straightened out. K2 controls the shift of the 9.00 MHz Carrier OSC between CW and SSB so can cause shifting, particularly on SSB.

I think the relay work probably took care of the 'drift' on SSB since I assume your 'local' QSOs were done on the lower bands.

What's next??

Garey,

Local communications have been on 10M. I lost my 80M dipole several years ago and since I hadn't operated in some time, I haven't installed anything for the lower bands yet.

After working on K2, the receive jumping / drifting appears to have stopped. The transmit frequency has been drifting while talking. This was not solved by working on K2. I'm hoping that the alignment of the crystal oscillator has taken care of this but until I can talk to someone on 10M, I cannot verify this.

I would like to try to align the rest of the radio but this won't happen until I can acquire the appropriate meter or probe to do so. I will also need some tutoring prior to screwing something up. I didn't know if I could get away with using a 1 meg ohm probe connected to my Fluke to do this satisfactorily or not.

After working all the bugs back out of what used to be a smooth operating rig, I would like to remove the old cigarette tar and dust as a final step. I attempted to wipe a portion of it down with a dry cloth but the lettering at the tubes came off. You discussed re-lettering and may just have to clean it with a dry cloth and suffer the consequences.

Thanks,

Doug Coffman

Lee Lagoon Blue, No.172, is about identical to the material used by Drake. Its available at places that sell photographic or theatrical lighting. See the Lee web site at:

http://leefilters.com/lighting/colour-list.htm

The gel can be cut with scissors and the holes for the screws punched with an ordinary paper punch.

Doug -

The 'slow drifting while talking' may very well have been caused by your fan blowing IN. What that does is force that hot air INTO the radio and around the BAND, CAR OSC and PTO oscillators. ALL oscillators are temperature sensitive to some degree, and blowing hot air on them is a way to do that! Add to that the heat INCREASE when transmitting and it wouldn't be much of a surprise if this was the case. On the other hand, blowing air OUT pulls 'some' room air IN, air that is pretty constant in temperature.

The S-Meter is the only tool you HAVE to have to do alignment. You can use the POWER OUTPUT function for some adjustments, but an external wattmeter is a lot more convenient. 95% of the alignment is adjusting for max (or min) of S-Meter or Output power.

I use GoJo White (non-abrasive) hand cleaner for cigarette smoke removal. I've never had it attack lettering, although that is always a possibility. The tube numbers are easy to replace, either with rub-on lettering or laser printed decal paper.

I have two working calibrators for my Drake 2A. Very simple problem in that I cannot zero beat either of these to the 10 0r 15 Mhz WWV reference. The trimmer caps are good and as specified as well as tubes that test favorably. Any ideas on what can be done to resolve this problem? Thanks,

73,

Terry W4WTC

Strange... The only failure I've seen, (once,) was a bad crystal.
Highly unlikely you have TWO bad crystals. From your question I'm
assuming they are 'working', just not on the right frequency?? How far
off are they??

Have youtried them both in both receivers?

Check to see if they're getting correct B+ when the CAL switch is on.
R65 and C70d if low.

Check resistor values.

Bad 100 pF capacitor.

Bad solder (cracked?) on power connector pins.

Hi Garey:

Actually, I only have the 2A, but the calibrator is the same for both receivers..Unless there is something slightly different about the calibrator circuitry that I'm not aware. The output is strong but I can only adjust the trimmer to within about 10 Khz of the zero beat target which would coincide with the frequency reference standard. I have another 100 Khz crystal but that does not seem to make any difference.they oscillate just fine. Is there anything on the pins that the calibrator plugs into that would cause some sort of frequency shift or adjustment limitation ? The output is clean and stable. A bit of a head scratcher as there is very little to the calibrator to cause a problem. May be as simple as a mislabeled trimmer cap. Before that surgery is attempted, I thought I would ask the experts ! TNX

Terry -

Well, if you believe that the trimmer IS correct (5-80 pF), you might try subbing the 100 pF cap. This cap was 220 pF in the 2-AC for the 2-A.

10 kHz is a LONG way away. Is it too high, or too low? Some of the early 2-ACs also used a 6BA6.

How confident are you in the 'standard' frequency you are using??? I find it HIGHLY suspicious that TWO oscillators are that far off.

Topic: 12707 Message: 12712

Hi Garey:

The frequency references are not the problem. I have two synthesized signal generators with recent lab calibrations so I know they are dead nuts on as well as the ability to receive WWV in the receiver itself. The calibrator is on the low side. at any frequency and falling exactly on the 100 Kc points.oops.100 Khz.sorry I'm showing my age. I'll try some substitutions again and see if I missed something. You are correct. the trimmer is shown to be 5-80 pF.

73,

TC

Subject: Re: [DrakeRadio] Calibrator Issue...Drake 2A, 2B

Terry -

Well, if you believe that the trimmer IS correct (5-80 pF), you might try subbing the 100 pF cap. This cap was 220 pF in the 2-AC for the 2-A.

10 kHz is a LONG way away. Is it too high, or too low? Some of the early 2-ACs also used a 6BA6.

How confident are you in the 'standard' frequency you are using??? I find it HIGHLY suspicious that TWO oscillators are that far off.

12713. R-4A Passband tuner slugs

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-20 21:42:07 UTC
From: Al
Topic: 12713 Message: 12713

I'm sure this subject has been brought up before, but I can't really find a lot of information about it.
In the manual where it tells you to set the passband selector to .4 and the tuning knob to the center of the shortest line, and then adjust the four slugs on the rear of the passband tuner for max AVC voltage, it doesn't say what kind of tool to use. I think I got it pretty close by using a long-nose pliers, but it was very tedious, and I'm not sure I got them all adjusted dead-on.
I don't see any slots for an alignment tool, and the ends of the slugs that stick out of the holes are kind of pointy but maybe a little bit flat.
I couldn't find anything that would work at all except a pliers. It seems like there must be a better way to adjust those things. (maybe not)

Thanks for any advice,
Al, WA2S

May be totally off the wall but I had a soldered in crystal that refused to be where it was supposed to be. After a lot of futile parts changing I ended up soldering the old crystal back and it was correct.
A buddy said the heat could have caused it to come around. Something grows on crystal?
Don't know if there is any basis for his claim, but it has been working correct for several years now.
No, it wasn't bad solder joint or broken pcb. Just spooky.

Lee Lagoon Blue, No.172, is about identical to the
material used by Drake. Its available at places that sell
photographic or theatrical lighting. See the Lee web site
at:

http://leefilters.com/lighting/colour-list.htm

The gel can be cut with scissors and the holes for the
screws punched with an ordinary paper punch.

I use a standard recessed flat blade technician's adjustment tool (known in its day as a "tweaker"). The blue Bournes PCB pot adjusters will serve the same purpose and make it MUCH easier than grabbing it with pliers!

If you go to this page:

http://radiojim.exofire.net/pages/blue.html

The background color is rendered from the RGB color code from the Lagoon Blue sample on Lee's web site. About halfway down the page, there is a sligthly different color blue box that is a sample of Rosco E-Color #172 Lagoon Blue. There are also links to the Rosco and Lee web sites.

Lee gels can also be purchased from eBay sellers, I got a good sized chunk of 172 for under 10 bucks.

I may be the one who recommended an alligator clip.
I've tried the adjustment tools of the sort you use and
found they tended to stick to the adjuster causing backlash.
These little tools were sold with many names on them,
Bourns, Spectrol, etc, all makers of small, ten or twenty
turn pots. The advantage of the alligator clip is that when
you let it go the adjustment does not move. I wonder what
was used at the factory, there may have been a special tool
made just for these cores. They can be very frustrating to
adjust.

12722. Schematic Help

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-21 01:07:03 UTC
From: Rich Arland
Topic: 12722 Message: 12722

I'm hitting up all three of my "boatanchor-type" lists in hopes someone has already done what I need to do and I won't have to reinvent the wheel.

Schematic diagrams: How does one take a small, in some cases a couple of pages out of a manual, enlarge them and put them together to obtain one, large schematic with no seams that and old phart (like me) can actually read!

My first thought was to hit Stapes or Office Max and have them take the two piece schematic from the HQ-110 and make a larger version.

Then I thought about a photo program like PhotoShop, Elements, NX-2, etc.

So, anyone on these lists have any experience/background doing somethng similar to this??

Older versions of photoshop had a "stitch" feature which would do just that- probably designed to take multiple photos taken on the same plane and turn them into a panoramic image. Worked slicker than snot for schematics. If you have an older version (sorry I don't recall what mine was anymore) you might look around and see if you get lucky.
For some reason, in their infinite wisdom, they removed it from newer versions. I would also be very interested to hear what is currently available that offers a similar feature.

There is a standard TV tuning tool that I believe was for Zenith TVs.... They had adjusters with a tip shaped like aspade lug, smaller of course, and the tool had a flat end with a rectangular hole in it. The other end is a flat screwdriver, a small piece of metal forced into the end of the tool.

I have a little yellow one by GC.

I just posted two photos in the Photo section. The same tool is also available in 'stick' type as I described above, usually with another format on the other end.

Certainly is odd.
Do you have too little C or the trimmer is running out at max C? Might try just adding a ceramic or mica cap (say 50 or 100pf) in parallel to the trimmer and see if the rock will "pull" that far and still resonate reliably upon command.

Rich -

That's how I domy Drake (and other) schematics. I use an old Photoshop Elements (the beginners photoshop). Scan in however many sections it takes, with overlap, and thenstick them together.

If you can make good 600 dpi scans (flat on the glass, no curves or shadows) and email, I can pastethem together for you. Split them up and include an inch or so overlap.

The ones on my CDs can be blown up to 4' x 3' printed at a FedEx Office with a large format printer.

73, Garey - K4OAH

12729. Re: [DrakeRadio] Bringing my TR-4 back to life... final problem list

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-19 01:11:17 UTC
From: Steve Wedge
Topic: 12677 Message: 12729

The muting may be a sticky relay or a VOX issue. How's V19?

I want to go with a leaky electrolytic cap for the "pulse" noise. It could be discharging across a defect internally and the noise afterwards could be "ringing". Unfortunately, the only way to confirm that involves disconnecting the originals and subbing in new ones. If your AC-4 is working fine with your other radios, look at C145 in the TR-4. It's a two-section can that's connected to the +150 and +245V supplies.

I've gone through the s-meter zeroing issues quite a bit. Although bad/gassy tubes in the AGC circuit can be to blame, don't discount a bad RF amp tube. I've replaced more than a few 6BZ6's lately that have been the cause of s-meter problems in the receivers. In the TR-4, however, the RF amp is a 12BA6. I'd check it anyway (V14), since you can swap it with V12 if you don't have any spares and see if anything changes.

Audio feedback could be due to RF getting into the audio. How's your grounding?

Good luck, Mark...

Subject: Re: [DrakeRadio] Bringing my TR-4 back to life... final problem list

While my TR-4 is now usable, there are still some remaining minor
problems to be addressed:
o Sometimes, when switching from X-CW to SSB after tuning
up, the receiver is still muted. However, switching back
to X-CW and then to SSB again seems to "fix" the problem.
o While listing on the 10m net Sunday, I was hearing almost
a low frequency "pulse" type noise. I'd put it about 10
to 20 Hz. It was not AC hum. It is less on the lower
frequency bands, but still there. It is also more
pronounced the higher the audio gain.
o The S-Meter zeroing doesn't seem to "hold". When switching
around the bands, the zeroing of the S-Meter will have to
adjusted. BTW, I'll switch over to my dummy load before
adjusting just to eliminate as many spurious signals as
possible.
o There seems to be some audio "bleed-through" in my head
phones when transmitting. (I'm using Kenwood HS-5 head
phones.) When I transmit, I can definitely hear my audio

in my ears.

All of these need to be fixed, but as I said, the rig is usable
and it does transmit and receive well.

My first step is going to be to check through the archives to see
if others have reported the same problems.

Now I need to rebuild my AC-3 and attend to my ailing TR-3 :-P

I've done that as simply as pasting each piece of the schematic into Microsoft Paint or PowerPoint. In Paint, you can erase bad areas, replace text, and other small corrections. It's crude, but it does work.

Regards,
Barry - N4BUQ

Don't forget the 'other half' of the capacitive voltage divider network. Either a 100 or 220 pF cap depending upon age. Use a good Dur-Mica or other NP0 type cap.

I've developed a "touch" for getting them adjusted. I also use a scope on the TP2 connection and adjust for lowest negative on each one. I go round twice to make sure they're all "in".

I may be the one who recommended an alligator clip.
I've tried the adjustment tools of the sort you use and
found they tended to stick to the adjuster causing backlash.
These little tools were sold with many names on them,
Bourns, Spectrol, etc, all makers of small, ten or twenty
turn pots. The advantage of the alligator clip is that when
you let it go the adjustment does not move. I wonder what
was used at the factory, there may have been a special tool
made just for these cores. They can be very frustrating to
adjust.

> of pages out of a manual, enlarge them and put them together to obtain
> one, large schematic with no seams that and old phart (like me) can
> actually read!

You may find the open source software package 'Hugin' useful:

http://hugin.sourceforge.net/download/

It's intended for panoramic photographs, but I suspect it will work
quite well for high-contrast images such as schematics. You may have
to set some control points manually. Simply take high resolution
scans of the schematics you want to use, stitch them with Hugin, then
take them to a copy shop and have them put on a tabloid size page!
:-)

Rich-

Garey had a good offer. If it doesn't pan out I just asked my xyl what she could do. She has 40+ years in typesetting and graphic arts. Yes, back when output was on paper tape! (Think Florida, chad, Jud Bush, vote tampering, etc.) If you can provide hi-res .pdfs she is willing give it a go. Knew I married the right gal!

Problem solved. The newer 2 AC Calibrator came with a new crystal and a 6CB6A tube. The original schematic calls for a 6BZ6 which I substituted and that solved the issue with the trimmer. Not sure if the 6CB6A is supposed to be an acceptable substitution but in this case it seems to directly affect the adjustment range of the trimmer. Thanks as always to the Drake group and in particularly, Garey, for all the support that is given. It’s appreciated !

Don't forget the 'other half' of the capacitive voltage divider
network. Either a 100 or 220 pF cap depending upon age. Use a good
Dur-Mica or other NP0 type cap.

Terry -

I never seem to go far enough back, assuming too much!! Yes, the wrong tube 'could' be the cause...! :-)

Looks like it 'oughta' work, same base, same intended function (B&W TV IF), even very close to the same inter-element capacitances. So don't know 'why' it didn't work, but I might have tried the same tube if I didn't have a 6BZ6 or 6BA6.

Fixed anyway!!!

Would a piece of flexible tubing over the end of the slug work? I don't remember what it looks like, but if it will fit through the adjustment holes, it might be worth trying.

Subject: [DrakeRadio] R-4A Passband tuner slugs

I'm sure this subject has been brought up before, but I can't really find a lot of information about it.
In the manual where it tells you to set the passband selector to .4 and the tuning knob to the center of the shortest line, and then adjust the four slugs on the rear of the passband tuner for max AVC voltage, it doesn't say what kind of tool to use. I think I got it pretty close by using a long-nose pliers, but it was very tedious, and I'm not sure I got them all adjusted dead-on.
I don't see any slots for an alignment tool, and the ends of the slugs that stick out of the holes are kind of pointy but maybe a little bit flat.
I couldn't find anything that would work at all except a pliers. It seems like there must be a better way to adjust those things. (maybe not)

Thanks for any advice,
Al, WA2S

Hi Garey:

One other point, and it may not be much of a problem, is that anyone who purchases the aftermarket replacement 2-AC calibrators will find they usually come with 6CB6A tubes. That tube works fine for signal generation but there must be slight differences in inter-electrode capacitances that may be the cause and limiting factors on the trimmer adjustment/interaction with the tube. I cannot find in any cross-references I've checked that the 6CB6A is a direct substitute for the 6BZ6. In my 2-A it made a significant difference.

I haven't had an A or B line on the bench in a long time but I know I have
an adjustment tool that fits. Before I got one I believe I used a piece
of brass tubing squeezed to fit. I don't recall the size of the adjuster
tip from memory so I don't know if a ball point pen refill is big enough
but you get the idea. You need something the fits securely but does not
"grab" as that "bumps" the adjustment when removing the tool.

Terry -

Interestingly, the only inter-electrode capacitances is that the BZ is 7 pF 'Grid to everything' and the CB is 6.5 pF! Everything else is identical. Even the 'gain' (8000 umhos) is identical. The only difference I see between the two is the BZ is a SemiRemote cutoff and the CB is a Sharp cutoff. I don't see how that would affect the frequency, but ....

Anyway, we know the 'right' tube DOES work. If you have a 6BA6, try it. It has far more differences than the CB......

You need to overcome the initial torque that's needed to set the adjuster into motion. The adjuster seems similar in size and properties to a low-E guitar string. Thus, it has some "springiness" when you first turn it.

I have not found any problems with using a pot-adjuster or standard technician's tool. You develop a feel for when to back off. I would suspect that something like rubber or plastic tubing would increase the backlash of the adjustment: if you can't find or don't want to use an adjuster, I'd go with the gator clip.

The slug adjusters are made of twisted wire with a flattened end. They are rather flexible. If you push something on to them to turn them it tends to move the slug when you remove it. The adjusters will also move in or out with pressure on them. They are slightly springy so have a lot of backlash when you try to use an ordinary socket type adjusting tool on them. I suspect the tubing would be no better. I don't remember what inspired me to try an alligator clip but I found they work. The clip holds the end of the wire tightly enough turn it without slipping and comes off without further moving it. They make a bothersome job easy. The bandpass assembly has four adjustable coils in it and a fifth adjustment, a lockable screw at the center which I think moves the entire rack to center it. The arrangement is interesting since it allows both variable bandwidth and enough tuning range to cover either sideband. The circuit works by varying the coupling of the coils but is not strict mutual induction coupling so the expansion is not symmetrical. You can find similar approaches to variable bandwidth in some Hallicrafters receivers where the band increases only in one direction. This is compensated for in the Drake IF by means of the calibration marks on the panel which indicate the effective center for the different bandwidths. By making the IF tunable Drake avoided the necessity of having to mechanically or electrically couple the BFO and VFO as was done (mechanical coupling) in the Collins 75A-4 to achieve the same purpose.

The easy thing to do is take it to any blueprint shop, they can blow it up to any size you want ! I do it all the time, sometimes I blow a schematic up to poster size and put it on the wall above my bench. A little overkill I admit but I own a blueprint shop so at least it's free.

In a message dated 3/20/2013 2:42:12 P.M. Pacific Daylight Time, aschichler@gmail.com writes:

I'm sure this subject has been brought up before, but I can't really find a lot of information about it.
In the manual where it tells you to set the passband selector to .4 and the tuning knob to the center of the shortest line, and then adjust the four slugs on the rear of the passband tuner for max AVC voltage, it doesn't say what kind of tool to use. I think I got it pretty close by using a long-nose pliers, but it was very tedious, and I'm not sure I got them all adjusted dead-on.
I don't see any slots for an alignment tool, and the ends of the slugs that stick out of the holes are kind of pointy but maybe a little bit flat. I couldn't find anything that would work at all except a pliers. It seems like there must be a better way to adjust those things. (maybe not)

Thanks for any advice,
Al, WA2S

Take them to your local blueprint shop, they can make them what ever size you want. I have blown up schematics in the past to 24x36 and put them on the wall over my bench....

In a message dated 3/20/2013 6:07:08 P.M. Pacific Daylight Time, k7sz@... writes:

I'm hitting up all three of my "boatanchor-type" lists in hopes someone has already done what I need to do and I won't have to reinvent the wheel.

Schematic diagrams: How does one take a small, in some cases a couple of pages out of a manual, enlarge them and put them together to obtain one, large schematic with no seams that and old phart (like me) can actually read!

My first thought was to hit Stapes or Office Max and have them take the two piece schematic from the HQ-110 and make a larger version.

Then I thought about a photo program like PhotoShop, Elements, NX-2, etc.

So, anyone on these lists have any experience/background doing somethng similar to this??

Thanks for the passband tuner info, Steve.
I have a bunch of alignment tools in my toolbox. I'll have to see if I have something that has a slot (vs a blade) that will fit the adjustment rods, or whatever you call those springy things. I like the idea of using a scope. I'll have to try that. It might be easier than the DMM I've been using.

I don't know why they didn't design that thing to make it a little easier to adjust.

Yeah, the DMM has too much hysteresis to be of use in peaking circuits.

The tool I'm describing has a flat blade that is recessed into the tool. Think of a screwdriver blade inside the end of a Parliament cigarette filter end

I actually tried Hugin for this, after producing several successful photo panoramas with it. No matter what I tried, I got some really bizarre output with schematic chunks as source images. I think it was the "lens correction" that Hugin uses; there is no profile, at least in the version I tried, for a perfectly flat source with no lens distortions. I gave up and haven't got back to it. Gimp and Corel Photopaint work.

FWIW, older CS2 stuff can be downloaded direct from Adobe, with serial numbers, here:

http://www.adobe.com/downloads/cs2_downloads/index.html

A tip for scanning text documents and schematics: to prevent bleed-through from the other side of the page, scan against a black background. I have a piece of black poster paper cut to the size of my flatbed. This may seem obvious, but it was a "DUH" moment when I finally figured it out. You may need to bump your tone curves a bit to get white back up to where it should be.

Dave,
I got hacked once, and had several responses from sheer idiots, who simply were not capable of comprehending the act. But, this is the best list, of it's kind, bar none, and to remain so, it needs as many different opinions contributing, as possible. I would hate to see that someone would leave over the actions of one idiot.
I remain a member on a couple of lists, who really set off my ire, due to over-moderation, and they over moderate, because of a few members who complain, simply because of those types of complaints.
I even got a snarky reply from someone, here, once, because of a rotating political signature line, that came up on my iPhone. Some folks just can't figure out where the delete button is, and have to whine and cry, when all they needed to do, was hit the delete button.
Please, don't let one fool, raise your ire, so much, as to leave this wonderful group of helpful people.

I'm sure I have alignment tools like you are describing, with a flat blade recessed in a cylindrical housing. I'm not sure just how that will grab and turn those adjustment rods/wires connected to the slugs. It seems to me that it has to be more like a slot than a blade, but maybe I'm just confused about that.
I'll take a look at all my alignment tools and see if any of them look like they might work.

From: branton_thomas
Topic: 12765 Message: 12765

Good afternoon everyone,

After a long absence from ham radio I am excited about re-entering the hobby and I am interested in a TR-7 station. If I found a nice one perhaps I could later add the R-7 receiver.

Any words of wisdom from past or present TR-7 owners would be most welcome. Anything I should particularly look for in a potential purchase? Any thoughts on what a nice TR-7 and power supply would cost? There is one listed on EBay at the moment.

Thanks and 73's

Tom

Mark,

Your recent documentation of work performed on your TR-4 is very much appreciated. I, too, recently repaired a TR-4 with the benefit of the group. With your shared experience I've been able to expand and update my own knowledge base.

The front panel of your TR-4 appears to be in very good shape based on the image you uploaded. I was not so fortunate with a large round scratch under the RE TUNE knob. I ordered a replacement panel from Tony, KF8MW, and with last year's PS rebuild (AC4R), my s/n 26104 looks and performs like new - thanks to help and introductions received from the group.

Many thanks, Mark, for an informative write-up.

Hello Tom,
Would suggest you go to _www.wb4hfn.com_ (http://www.wb4hfn.com) (DRAKE) and looking at the file on whats in a TR-7. That file explains how to tell early from late (one piece back vs three piece back) as an example. Black cases vs the dark gray etc. Different boards early late etc. There is also a section on used gear pricing. You can spend hours on that website.

Personally I'd be looking for one with functioning digits, the digital board was an option, then did it have the NB7 (noise blanker board) or not. The Aux 7 board is not a critical item as you can use the up/down to get there. I built my own.

Package station on Epay did look nice but I didn't really study. Have you looked at _http://swap.qth.com/_ (http://swap.qth.com/) .
One way or another welcome home and good luck. Carl wd8nhk

Tom -

Welcome to the group! I'm kind of surprised you haven't gotten more replies. There are several very knowledgeable TR-7 owners on here.

I think it's a great radio, I have a TR-7 and R-7 pair on my desk right now. It doesn't haveall the multifunction (press button A three times in less than 2 seconds to change bandwidth, etc.,) but it also does not have all of the custom ICs that the manufacturer discontinues after a few newer models come out! :-)

The radio is 30+ years old, all but some cosmetic parts are still available, no surface mount parts, i.e.,you can repair it yourself if necessary. The majority of problems are the result of mild corrosion on the plug-in card connectors, easily fixed by merely pulling up slightly and reseating.

In my experience a serial number above 6000 would appear to have all the 'latest' upgrades. The TR-7A came at about 10,000, and essentially the only difference was the optional CW filter, Noise Blanker, and a surge suppressor on the antenna input. The "A" increases the price considerably because of it's rarity for collectors, but is not and 'improve' radio.

Check <www.WB4HFN.com> for a lot of information on the TR-7 and all the other Drake products.

Tom,

You have lots of good comments already. The price you pay will vary, depending on options installed. I would look at the filter compliment to see if it fits your operating needs. My personal preference is a narrow SSB filter and one CW filter, at least. The noise blanker is nice to have, it can be quite effective on some types of power line noise. Despite opinions to the contrary, I have found it to make the difference between making contacts and hearing almost nothing when the power lines around me get active.

I think it has been mentioned that you can find better deals at hamfests than online. Although I have a friend who has had reasonably good luck with several eBay TR-7 purchases, I have seen several good deals recently at hamfests. Unless the seller *knows* what options are installed, you really need to pull the covers off to be sure. The matching PS-7 is not a "must have" to use the radio, but it is a well built unit that seems practically bullet proof.

Be prepared to do a little maintenance. The TR-7 can develop intermittent connections in the Molex PC board connectors over time. Easy to fix. A check of the fixed passband alignment is also recommended, and easy to do even if you don't have test gear. There is one electrolytic cap in the radio that I recommend to be replaced due to age. The rest are getting old too, but seem to be holding up reasonably well.

The R-7 is a nice cherry to add to the package. It has some features that compliment the TR-7 nicely, and adds a degree of flexibility that you will only truly appreciate after you use the combo for a while, without all the button pushing that Garey speaks of.

Fans. You will want fans on both the TR-7 and the PS-7. The fan is an off the shelf part in a standard form factor, so they are easy to add. You will pay a premium for a loose fan with the "FA-7" sticker, but OEM equivalents are cheap in the surplus market. It's a 19 CFM, 120V, as I recall. I have some 32 CFM NMB fans that would fit nicely, but they are way too loud for continuous use. I put one on a DL-1000, it looks just like an FA-7 without the sticker!

7-line gear is primo stuff, IMHO. Properly running, you won't find a better rig for the price. I've had one for 25+ years, and they will have to pry it from my cold, dead hands...

Hi all,

Selling my Drake TR-M.. M = Marine
It is brand new, never put it in the boat.
Obviously never used, still in its original Drake unopened box.

This is an HF rig. SSB or AM 150W PEP

It has the optional 12 V power supply.
It has a built in antenna tuner, can tune a 23 ft vert. antenna, long wire
or ?
It has a mic , which I understand will be a Turner by brand.
Assuming typical new Drake the manual for same will be in the box.

If interested please contact off list at _Chgypsy@..._

Good morning everyone,

I wanted to send my thanks for the guidance and recommendations I received from members. I got some great advice and a lead on what may be a fine rig for me. If a further thought occurs to anyone you would like to share on the TR-7, please do so.

Kindest regards and 73's

Tom

Good Day All,

Does anyone else have one of these excellent testers in the shack...?

If so, is there any chance that yours may include the testing settings / parameters for relatively newer compactron tubes, such as the 6T9, 6U10, etc. etc.?

Many thanks!

Eddy:

I have one of those – came across it at a very attractive price last summer. Not at home until tomorrow evening but will check and see – it's the one with the compactron adapters so should have the data as well. LOTS of switches on that tester, aren't there!

Not sure what to do with the 9-66 now – offered to help an 80 year old remove his towers and antennas last week and he wouldn't let me leave without taking his TV-7C/u tube tester, along with a National NC-125 and a Trio 9R-4!

Back to you late tomorrow evening.

Hi Peter,

Gee, that'd be just great! Many thanks...

I bought mine here some 10 years ago, basically just to shut-up a fellow worker who had one left-over from his father-in-law's estate. I gave him $25.00, & he was as happy as a pig in...well, you know what!

Since acquiring it, Ithough, have really come to appreciate the thing---it'll event test 811A's, 6146's, & 866A's! What a wonderful tool. Mine came with extra booklets & sheets that show how to test tubes even as old as the 201A---but there is NOTHING re. the testing of compactrons...

So Peter, if you have details re. these, I would really love to hear from you!

Many thanks in advance, & vy

12784. T-4 Reciter woes...

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-24 04:45:42 UTC
From: qrper
Topic: 12784 Message: 12784

All right boys and girls, I have a strange one on the bench.

It's the rather rare Drake T-4 reciter.

here's the problem

With NO injection from any receiver (the T4 has NO vfo)

I'm producing 140+ watts

Only it's on 5.64 mhz. Yeah, the carrier oscillator freq.
And about 140+ watts on 11.3XX, double the carrier freq.

Transmitter gain at zero, 140 watts out on those two freq. So, yeah, something is singing and passing the carrier freq.

so, Pulled the 12ax7 V1, and with NO tube in the oscillator circuit, whoa! 140+ watts out.

If I take my oscope probe or the meter probe and touch pin 5 of the 12ba6 just out of the balanced modulator, the output goes to zero. Just touch it!!! that's all and NO rf output.

of course I've swapped in known good tubes, and no joy.

Tested all tube

Volages at the tubes seem to be within reason.

This one has me scratching my head...

anyone?

Mike, wb8vge

12785. Re: [DrakeRadio] My non-working TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-24 05:04:17 UTC
From: Howard Traxler
Topic: 12538 Message: 12785

Hi Garey and thanks. Finally got to check out the local oscilators.

Garey: On 40M the Carrier Oscillator runs at 9.000 MHz,
Me: I have a carrier at 9 MHz on all bands. It turns off when I switch the mode to AM. There is a microphonic tube near the rear of the radio. Tapping on the tube makes noise on the local oscilator carrier and in the transceiver's speaker.

Garey: the crystal oscillator runs at 21.5 MHz.
Me: I can hear that one on a radio tuned to 2150 MHz but only when the transceiver is set to 40M. Tuning the xcvr's VFO I get a hetrodyne with the 2150 MHz carrierat about five turns from the clockwise end limit.

I hope I can assume that the protection lamp is OK. It looks like a real chore to get the final cage off of there. A job for the XYL to help with if it really has to be done.

Further suggestions, please? Thank you.

Howard, WA9RYF

On 40M the Carrier Oscillator runs at 9.000 MHz, the PTO covers 5.455 t0 4.955 MHz from 0-500, and
the crystal oscillator runs at 21.5 MHz.

Yes, only PA tubes inside the cage.

Don't remove tubes from sockets, just rock them back and forth a little one at a time.

Yes, the bulb is inside the cage, on top of the chassis. It's round about 1/4" in dia.

One of the TR4's it is under the chassis, near the antenna connector and relay, the other one is in the final compartment. Look closely in that area very near the antenna connector and you will see it plugged into a socket. The contacts are most suspect, unless you had a transmitter too close and blew the bulb.

12786. TR-4Cw completed

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-24 14:23:37 UTC
From: slowcountry1
Topic: 12786 Message: 12786

The purpose for this email is to offer a huge thanks to those that helped me return my TR-4Cw to full, consistent and stable operation. (Knock on wood).

Early last week I aligned the oscillator responsible for the operation of the band crystals. There was significant adjustments required to obtain the required negative voltage which resulted in stabilizing the 10M crystals. Following this alignment, there has been no further drift in the transmit frequency. A couple of days following this alignment, I also reversed the cooling fan to withdraw heat from the PA area as suggested.

Two days ago, I proceeded with the rest of the alignment process. Most everything was already set, only a couple of small tweaks were required. This seems pretty good for a 30+ year old rig.

Yesterday, I completed the work by cleaning the chassis top. I attempted to remove the old cigarette scum with toothbrushes and distilled water. Unfortunately, the chassis lettering vaporized but the scum did not. I was able to remove all of the grime with 409 household cleaner and a tooth brush. Aluminum cleaner was used on the SSB filter tops, connecting rods to the front panel and the three tube covers. Everything looks quite beautiful. There is however some minor discoloration / or possibly corrosion in a few places. I did not attempt to clean the bottom of the chassis.

I have a source for new light bulb and blue filter material. The covers will be going back on the rig within the next couple of days, hopefully and will actually signify its completion.

If one were to compare this rig to a brand new factory unit, I would suspect the grade would be 8 out of 10. I am extremely happy to have the unit back at full tilt, not only because I absolutely enjoy operating it, but the fact that it was left to me by my deceased grandfather 10+ years ago.

Once the covers are reinstalled and the unit is put into its permanent place, I will start the process on my TR-6. I have two older TR-4s, that I purchased 8 years ago with known problems, those will follow.

Through the help of those on this list, I have gained quite a bit of experience and confidence working with this gear. I wish to express my gratitude to those people who maintain, contribute and moderate the list and for the willingness to help a fellow ham. To anyone attempting a repair or restoration, Garey's CD's are an invaluable tool and in my opinion, a must.

Thanks to all,

Doug Coffman

I purchased a TR-4CW with RIT about 10years ago as a project radio and then ham radio fell by the wayside. The person I purchased the rig from stored in a very wet environment, the chassis has a great deal of rust. Upon inspection, there have been a bunch of unknown modifications, a real hack job. Someone painted the tube covers black and put a real crappy black paint job on it. Some day, I will revisit the idea of refurbishing the rig but its going to take an act of god to get it going.

I would love to get that one going, that would be a real accomplishment.

Doug

Howard -

OK.

The 9.00 MHz is good, and 'should' be heard on all bands. That is the Carrier Oscillator. When you switch to CW or AM, it is 'moved' about 1 kHz lower in frequency.

The 21.5 MHz is good, and 'should' be heard only on 40M. That is the Heterodyne Oscillator. It will be different for each band.

When the PTO is tuned to the '000' point, it should be heard at 5 MHz. This is a tunable oscillator, and so may be a few kHz, (up to 10,) either side of this frequency.

The final cage isn't that hard to remove, the TUNE and LOAD shafts just pull out of the couplers that go through the side, and then remove the small screws. Obviously power off and power supply unplugged.

You didn't answer whether you had PA Bias current when you closed the PTTas described in Section 4, para A in the manual.

One of the TR4's it is under the chassis, near the antenna connector and relay, the other one is in the final compartment. Look closely in that area very near the antenna connector and you will see it plugged into a socket. The contacts are most suspect, unless you had a transmitter too close and blew the bulb.

Mike -

Yes, the CO runs at 5.645 MHz, and if the transmitter is keyed with
_NO LO_, the RF TUNE, TUNE and LOAD can all be adjusted to 5.645 or
11.3xx just fine for full output. A T-4X will do the same thing if
the PreMixer is dead.

No mystery....

Mike -

I just re-read your post, and this is probably just a bit different.
Since V1 is out, V2 must be oscillating on it's own. It is just a
buffer amp, and with no drive it could very well oscillate. I assume
the frequency is not 'exactly' 5.645 MHz!

Again, not likely a real problem, just an anomaly for a stage that is
sitting there with no drive.

Hi Peter,

If you DO need the info, just give me the word---the date on the roll is 1971, which is far newer than the original roll on my tester...

It consists of some 17 separate pages, or so.

Just let me know & I'll be only too happy to forward it onto you as an attachment.

BTW, I still use those Drake Twins that I purchased from you several years ago, at the summer cottage. I had to re-build the PTO for the T-4X because of old age affecting the resistor values, & some solder joints that finally died on me. But it was well worth it: the thing runs like a champ, & I learned a lot from the experience. Best of all, it helped me to overcome my fear of rolling up my sleeves, biting the bullet, & dis-assembling the PTO!

I purchased a TR-4CW with RIT about 10years ago as a project radio and then ham radio fell by the wayside. The person I purchased the rig from stored in a very wet environment, the chassis has a great deal of rust. Upon inspection, there have been a bunch of unknown modifications, a real hack job. Someone painted the tube covers black and put a real crappy black paint job on it. Some day, I will revisit the idea of refurbishing the rig but its going to take an act of god to get it going.

I would love to get that one going, that would be a real accomplishment.

Wanted Drake Elmer

I am looking for a Drake Elmer, Someone who lives in the Dayton - Columbus, Ohio area who would be willing to Elmer me on testing and repair of Drake C Line series radios. I don't have the equipment or knowledge to do this myself and maybe I am too old to learn, but I will give it my best effort. I would be willing to compensate my Elmer for the time spent teaching / repairing the equipment. Please email or call 937-215-1456 if you are willing to help.
Thank you and 73,
Ralph AA8P

First thing is to get the CD offered by Garey Barrell
of this list
www.k4oah.com
It has complete, high quality, PDF's of the factory
service manuals plus a manual put together by Garrey with
photos and other stuff the factory manuals do not have.
Even if you find someone to help out the material in
the disc will make life easier.

HI

Help me , for Potentiometer TR4c (rcvr gain - rf - power)
The
problem of the potentiometer, is as follows:
A part of Stick it carbon (part Audio 500k log.) is consumed, is interrupted.

I would like to replace the audio portion of potenziometer, which today is
the potentiometer (make and model) where to get the part to replace, (size and
characteristics)

Best regards

Bye Frank

Garey,

I was up till almost four am working on this transmitter.

Here's what else I've observed.

with the R4a connected (injection) there is no 40 meter (or any other band) output, only the 5.64 and doubled freq.

yes, there is injection from the R4A

Now, all of a sudden, the thing started to work. But the RF tune control is very, very, very touchy.

Then I'd get no output, a little bit, and then full power. 20 meters is low, only 50ish watts, and 15 meter almost nothing, while I can't see to nudge 10 meters at all.

80 seems to produce power, about 125ish watts.

I've done the usual stuff, cleaned the connections, tube sockets, swapped tubes and so on and I am still scratching my head

Mike -

Well the R-4A should be sending over 12.645 MHz with the PTO at '000' on 40M. Obviously mixed with the 5.645 MHz CO produces 7.000 MHz. I imagine the 'touchy' RF tune is because something is still oscillating. You DID put V1 back in, right?!?! :-)

Is the RF TUNE peaking where it 'should' be for 40M? I wonder if someone has been 'fixing' the front end slugs??

I think they were adjustable in the T-4, unlike the later transmitters. They are all at the same height as in the later ones. Caution though, IF they ARE glyptal sealed, don't adjust them.

I would verify that the three signals are present and getting to the Mixer (V3) stage. If they are, you WILL get 7.000 MHz output.

The A-Line (Early) CD has an early manual which has alignment information for both the T-4 and the T-4X.

Take them to your local blueprint shop, they can make them what ever size

you want. I have blown up schematics in the past to 24x36 and put them on

the wall over my bench....

In a message dated 3/20/2013 6:07:08 P.M. Pacific Daylight Time,

k7sz@... writes:

I'm hitting up all three of my "boatanchor-type" lists in hopes someone has

already done what I need to do and I won't have to reinvent the wheel.

Schematic diagrams: How does one take a small, in some cases a couple of

pages out of a manual, enlarge them and put them together to obtain one,

large schematic with no seams that and old phart (like me) can actually read!

My first thought was to hit Stapes or Office Max and have them take the

two piece schematic from the HQ-110 and make a larger version.

Then I thought about a photo program like PhotoShop, Elements, NX-2, etc.

So, anyone on these lists have any experience/background doing somethng

similar to this??

Bob
as long as the rigs are decent, don't care a lot about sn#'s have manuals for all the drakes from Garey. I have several supplies also. I got into SDR 8 years ago with a kit sdr-1000 went up to a 5000 and ended up running a 1500 with a amp, but mostly QRP. that with my heath twins, ft-1000d and a few other old rigs ,balances out well. I still have a beautiful r4b and want to put the drake line back on the air ,if I can find a decent transmitter.
thanks
dale wt4t

Hi. I wrote about a week ago. I'm going to send you some photos of my 2 T4X's. do you want the serial numbers? Do you any PS or speakers? I'm looking to get into SDR now. An abrupt change from tubes , I know.
Thanks for your time.

Hi all,
Sometime back, I think it was this Drake list that had an individual that had some RG62/AU available in short pieces to be used as jumpers between transmitters and receivers to run transceive. I am looking for a chunk about 60 inches long with which to make two jumpers - 28 inches long with RCA plugs on both ends on each cable (or without 'cause I have the RCA plugs here.
I just don't want to have to buy 100 feet for a special application. Please contact me off list if you wish: barcand@...

I found a few tools that worked, including ones with a recessed blade.
The one that just had a slot at one end seemed to work the best, so I
used that.
Adjustment was easy using an oscilloscope set to a sensitive DC voltage
range and the tweaker with a small slot at the end.

From: Jim Shorney
Topic: 12808 Message: 12818

I would concur with Keith's reply. However, the original question was not specific as to which response - TX, RX, or both. The TR-7 has stellar TX audio as-is. A modification has been developed to switch in the AM IF filter on AM transmit, so the same thing could be done with a wider SSB filter as an option for both TX and RX. Or, the "stock" SSB filter could simply be replaced with a wider SSB filter, if you can find (or build) one.

I you are just looking for wider RX response, there are some modifications published on the internet to imrpove the bandwidth of the audio stages. I think some mods for the TX audio may exist as well, but most people seem happy with the TX audio as-is. You can also use the optional 4 KHz or 6 KHz AM IF filters for wider response on SSB RX. I would not sub in a 4 KHz (or 6 KHz) IF filter for SSB transmit, that would consume a little more bandwidth than would be considered courteous to your fellow hams.

Lots of folks retrofit 3 wire line cords in older equipment, originally coming with 2 wire cordsets. Since the metalwork would normally involve built-up gear, what is a good way to enlarge an existing "double D" hole to the next size up? Not many of us would pop for the $200 greenlee punch, so what is second best? Nibbler, filing, etc??

Hi David,
I usually use a tapered reamer. I have 2 or 3, with different tapers, they're either Tee handled or with a hole thru which you can slip a round shafted screwdriver to use to turn it. I don't know where they might be available nowadays, I've had them for a long time. I'm sure a google or similar search will turn something up.
There's sometimes limited space behind the back of the chassis, so you have to watch out for interference with wires or components.

Grommet the hole if possible and use a doubled over zip tie on the inside. Your cord doesn't move around much. If you can't grommet then I have used the shrink tape on the cord at the pass through point.

From: Steve Wedge
Topic: 12820 Message: 12827

For the receivers, you may be able to find a suitably small cross-section cord that will work in the existing hole, with a different grommet. There are fairly flat power cords that are rated for lower power that would work here. Since the 4-Line receivers only use less than 100W, you'd still be well within the ratings of the smaller line cords.

Something like this would work with a standard rubber grommet and would make it so you wouldn't have to cut up the chassis:

http://www.allelectronics.com/make-a-store/item/LCAC-303/3-BLACK-18/3-IEC-DETACHABLE-POWER-CORD/1.html

This is 0.26" OD.

I've seen a number of laptop power cords that are smaller than this.

Subject: [DrakeRadio] enlarging line cord holes in metal

Lots of folks retrofit 3 wire line cords in older equipment, originally coming with 2 wire cordsets. Since the metalwork would normally involve built-up gear, what is a good way to enlarge an existing "double D" hole to the next size up? Not many of us would pop for the $200 greenlee punch, so what is second best? Nibbler, filing, etc??

David -

Several have suggested 'taperedreamer'. That usually refers to a pipe reamer, which is much larger. I think they are referring to a 'T-Handle Reamer' which goes from about 3/16" up to 1/2". Typically around $10-15 most hardware places.

Easiest is to enlarge to rubber grommet size, otherwise lots of filing.

There are also those doohickeys (sort of like red noogies..) that are called either strain relief, or line stress relief (I forget...everything). They are like a split grommet that snap together as they are inserted into the hole, and grab onto the line cord with quite a bit of strength.

Grommet the hole if possible and use a doubled over zip tie on the inside. Your cord doesn't move around much. If you can't grommet then I have

used the shrink tape on the cord at the pass through point.

One of those stepped drill bits made for expanding holes in sheet metal- looks like a Christmas tree. If the hole has a flat spot on one side, you will need to file or ream it out to a round hole before using the bit.

The double zip tie thing is functional, but hoakey. Get the correct size Heyco strain relief for the cord you intend to use, make the appropriate size hole, and pop it in. Pliers work, however there is a special tool made for them which works slicker than snot. A heck of a lot more professional looking.

GL

From: Bill Breeden - NA5DX
Topic: 12820 Message: 12832

David,

I use a Heyco strain relief that works equally well in a "double D" or round hole. When I need a bigger hole, as I have with several pieces of Drake 4 line gear, I drill the hole out to the 1/2 inch size required for the strain relief with a regular 1/2 inch bit and my variable speed drill at slow speed. It usually takes less than a minute to enlarge the hole and the Drakes I have done that way all look they were born with a three wire cord.

73,

Bill - NA5DX

The problem with the tapered reamer is depth. There is often not enough room inside a chassis to use a tapered reamer.

In most cases the best solution is a file.

I bought my tapered reamer at Ace Hardware.

That's the type of bit I was referencing- they really do work well, about the best way to reliably make or expand holes in thin sheet metal.
There are MUCH less expensive variants available at your local home improvement store that are good enough for this kind of stuff. Still expect to spend over $20 on one though. You won't regret the purchase.

Geez, I didn't know they were that much! I picked up 2 of them at a garage sale for $4. They are often seen at such sales and flea markets for a nominal price. They do a great job of enlarging holes in various step sizes.

Subject: [DrakeRadio] enlarging line cord holes in metal

Lots of folks retrofit 3 wire line cords in older equipment, originally
coming with 2 wire cordsets. Since the metalwork would normally involve
built-up gear, what is a good way to enlarge an existing "double D" hole to
the next size up? Not many of us would pop for the $200 greenlee punch, so
what is second best? Nibbler, filing, etc??

Perhaps your machinist was not familiar with the Watts Square Hole drill bit. Patented by Henry Watts in 1917, it makes a square hole with very slightly rounded corners through the use of a Reuleaux triangle-shaped cutter. Watts Brothers Tool Works is still in business today making these things. I remember seeing them used for certain operations in the drill department of a shop where I worked in the mid 60's. They were sort of noisy, but they worked.

For those who care, an explanation of the tool's operation follows (taken from http://www.mikesenese.com/DOIT/2011/10/drilling-square-holes-with-a-reuleaux-triangle/) .

"Circular motion can be converted into a four-sided square using the Reuleaux triangle. The process relies on the property of Reuleaux triangle's diameter being consistent across all points, and when rolled and rotated simultaneously, tracing a square area with slightly rounded corners. By slightly altering the shape of the triangle to mimic a drill bit (for cutting and extracting material), a drill with a specialized rotating chuck can create perfect, four-sided holes. These drills were pioneered by Harry Watts, and can still be found today, albeit not at your typical home improvement store."

Bob -

I used to make square holes on a Bridgeport. Yes they had a small
radius on the corners, depending on the smallest mill I hadn't
brokenyet! If they REALLY had to be square it took only a couple of
swipes of a file.

Remind me when I was a kid...I had a Saturday job, washing the trucks of a concrete company that was down the street. The company's employees always drove the trucks to the wash pad, so when one day, the boss came over and told me to get the Mexican dump truck from the foreman and wash it, I was ecstatic....thinking I was finally going to get to drive one of the rigs....until the foreman pointed out the wheelbarrow on the side of a 'mixer. Yeah...I learned! LOL!

12846. TR4C cathode resistor values....

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-26 00:35:20 UTC
From: milton_valerio
Topic: 12846 Message: 12846

I noted that the cathode resistor was black due to high temp so I decided to change it for a new one, 3 different schematics I have shows a 270 ohm so I installed a new 270 ohm, to my surprise now I cant zero the S meter so.
Would it be possible that some models of TR4's came with different value resistor or the one installed was masking something else??
I replaced also the tantalum capacitor for a new fresh 10mfd one.

12847. ac-4 power cable

Date: 2013-03-26 01:16:59 UTC
From: yash@aol.com
Topic: 12847 Message: 12847

Just picked up a ac-3 that someone cut the feed cable off about 4 inches from the supply. Any recommendations as to what to use for replacement? what was there looked just like the cable I used on my rotor feed. gray cover 9 wire with 3, 14 and the rest 16 gauge. all are stranded wire. Luckily, I had a extra jones plug. If this wire is not good, what can I use and where can I buy some.
thanks

Hi,
I think you are looking in the wrong place, or at a fuzzy copy. I have never seen anything other than 15 ohm resistors in the cathode of the 6JB6's in any Drake. Using a higher resistance will make the meter peg, and not allow proper reading of the plate current for setting bias or operating. Probably would effectively increase the grid bias to reduce the idling current if it hasn't been adjusted, and not cause an overcurrent situation.
I've just ckd my cc's of a TR-4 and a TR-4Cw skem, both show 15 ohm, the TR-4C is fuzzy, but I think it calls for 1 or 2 watt units, 2 is what I've always used.

Problem with rotor cable - assuming ratings were followed on the original - is that the insulation isn't rated for the HV plate voltage. I think most of those cables are rated for 600V or less...

Milton -

ALL TR-4C Cathode resistors (I assume you're referring to the 6AQ5)
are 270 ohms. If the S-Meter won't ZERO, you have a different
problem. Possibly with V4, V11, or V15.

yes, I noted that I was very sleepy and I soldered the tantalum capacitor backwards, hahahahaha I reversed it and it is working perfect now. by the way the previous owner soldered a 10 ohm resistor thats why I was wondering if there was the possibility for different values cause I never seen before other than 270 on an 6aq5 tube.

12856. TR-4 Relay

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-26 13:11:44 UTC
From: Steve Wedge
Topic: 12856 Message: 12856

I know I've seen a discussion or two about this. I've got an opportunity to purchase a TR-4 with the relay and SO-239 missing. I anticipate it's a bit tight "in there", but how about availability of a relay that will fit without hacking the rig?

Are there any stock relays out there that would work?

Yes the number for it has been printed many times (I'd have to look it
up), AND Drake had a small circuit board for that area for a plug in one. I
have done so in the past.
I don't know how much wire you have left from the cut out, so yours may
be a bit more difficult.
The source for the small board was John Kriner (TR7dude on Ebay) whether he
had any more I don't know.
If he does not let me know. Carl wd8nhk

Steve -

The relay is the same one that's used in the TR-4C, P&B/TYCO/??
R10-E1-Y4-V2.5. Mouser, et al have them in stock, about $25 last time
I looked.

John Kriner may still have the small PC board to mount it in the
TR-4. The board fits over the feedthrough capacitors coming up from
the chassis, and about a half dozen or so wires. It comes with full
installation instructions. Not a tough job as long as the leads
haven't been cut too short. Several terminate right in the area, buta
few come out of harnesses under the chassis.

Bingo! They do have them at Mouser. Thanks, Garey.

Steve -

The relay is the same one that's used in the TR-4C, P&B/TYCO/??
R10-E1-Y4-V2.5. Mouser, et al have them in stock, about $25 last time
I looked.

John Kriner may still have the small PC board to mount it in the
TR-4. The board fits over the feedthrough capacitors coming up from
the chassis, and about a half dozen or so wires. It comes with full
installation instructions. Not a tough job as long as the leads
haven't been cut too short. Several terminate right in the area, buta
few come out of harnesses under the chassis.

Are there any stock relays out there that would work? Steve Wedge, W1ES/4
Yes the number for it has been printed many times (I'd have to look it
up), AND Drake had a small circuit board for that area for a plug in one. I
have done so in the past.
I don't know how much wire you have left from the cut out, so yours may
be a bit more difficult.
The source for the small board was John Kriner (TR7dude on Ebay) whether he
had any more I don't know.
If he does not let me know. Carl wd8nhk

Last nite, I did enlarge my little double D Heyco hole to a larger one. I used a nibbler and a round bastard file. THis was on a Eico 235, 20 gauge steel. THe biggest issue is that the had nibbler worked "blind", having to be used with the tool on the outside of the chassis. Anyway, small bites and mexican mill touchup did the trick. Hard to tell with the fitting installed it wasn't punched.

Garey
I have often wondered about that. If a wire is rated 600v to ground and it is next to an equal rated wire then isn't the actual rating wire to wire 1200v?
OTOH I am more concerned about the voltage rating on the connectors
The original Jones plug / socket was rated at 730vrms @ sea level
The new equivalent with plastic shell which is what is available is rated much less. Works fine but don't look at the rating.
AMP Supply obviously wasn't concerned. My LK550ZC with 2kv external transformer uses same series to connect the transformer to the amp chassis.

Paul -

I think that's what I said!!!? :-)

Yes, the connector being sold today is plastic. Even the original phenolic connector was only rated for 250 VRMS! That's about 700 peak (DC), so not much margin. On the other hand, 50,000+ transmitters/transceivers were built with them, and I've never seen a case where one broke down to voltage. Certainly there had to be some margin '+', but ...

Theplastic ones from Molex are rated only "250 V", no RMS! Hopefully that is also RMS.... :-)

I think I thought that is what you said but wasn't sure.
Molex doesn't really say much about ratings and I'm not real worried about using them (to the point of paying inflated ebay price for an old connector) but in the industrial side of the shop we couldn't do it.

I have always wondered what the rating of the original cable was, because I've never seen anything really extraordinary about it otherwise.

If they were using regular off the shelf cable, it does make replacement a lot easier.

It would be interesting to find out. Given that our needs today in 2013 are not the same as they were 50 years ago, it's hard for me to say. I suspect a lot of the other transceiver manufacturers would have used something very similar, if not identical.

At any rate, I do seem to recall that most insulated, non-Romex wire was and is rated for 600V and I had looked around at making a substitute at one time (hence my remembering the 600V rating). It is conceivable that the B+ wire could be in proximity to the shield wire, so I'd probably suspect that they were used close to their ratings.

Again, it would be interesting if someone could find the original spec from Drake.

From: William Houghton
Topic: 12873 Message: 12873

Hi Garey,

Are the PTO's from TR-3's, TR-4's, and TR-4C's interchangable? I don't recall if this has been discussed before.

Thanks,

Bill

From: Garey Barrell
Topic: 12873 Message: 12874

Bill -

Yes and no.... :-)

The TR-3 is a tube version so not feasible.

The TR-4 and TR-4C are different because of the dual dial system on
the "C".

The TR-4CwRIT is different because the RTTY shift function has been
replaced by the "RIT" function.

So the TR-4 and TR-4C/ CW would be interchangeable within the same model.

Found my Dremel tool (and appropriate bit) very useful for this purpose. Leaves a burr-less surface. Requires a steady hand. Did an AC-4 this way last month. 1) tape off inside chassis with painter's blue tape, 2) grind hole to dimension, 3) vacuum skree from the tape "cup", 4) install new AC cord and polypro cord lock. No problems.

The compromise I made on my 2B was to use an IEC round AC cord of fairly small diameter and just a plain grommet instead of a strain relief. Then I secured the cord inside the 2B using a P-clamp to a terminal strip stud near the hole. Works and looks a treat and no chassis cutting.

From: Paul Kraemer
Topic: 12847 Message: 12877

Steve et al
Back in the day at the AEC research reactor where I was employed as a tech while attending ISU we techs made numerous special cables for in and around the core. Made them because either there was nothing like what was required and commercial cables did not respond well to neutron flux.
The proceedure was then and still works here today
Put the wire spool cart in the hallway
Pull all conductors at once in the same direcion
When all conductors including any internal coax were present the one end of each was stripped, twisted, soldered, attached to the fish tape which had been inserted into a length of pvc jacket and the entire bundle pulled through. This required application of talc and sometimes inflating the jacket with hi pressure air on the 100 ft long cables. Pulling all the wire in the same directtion off the spool makes it want to recoil in an orderly manner. The pvc jacket was the next size HST required but DO NOT shrink it after---looks like home made then.
I make any special short cable I need / want today---same way. The only other resources I have is my industrial control business provides me a nice inventory of mil spec wire in assortment of gauge and color---even striped. My marriage provides my able assistant---it is NOT a one person job.
So, I offer, if anyone wants material for a special cable I am willing to share the resources for that at just above what it costs me to replace at current price. I will assemble the cable too for cost. I'll even put the connector(s) on but then some may consider them too pricey. It does take time (usually more than I estimate) to do it right.

Date: 2013-03-26 21:51:40 UTC
From: Kevin LaHaie
Topic: 12879 Message: 12879

I received in exchange for a radio repair a 34-PNB noise blanker, but my TR-4C already has one.

Tested in my TR-4C and works just like my other one.

This one is a bit different than mine, having a bracket for the plug, where my other one has the plug on wire pigtails.

Claims to be valid for TR4 Xcvrs with serial numbers above 31321

A little corrosion on the frame, can send pix

Contact off list if you are interestedin this sometimes hard to find accessory.

Thanks to the list for the bandwidth.

Hi Steve.

I picked up the relay PCB with the socket mounted from the "tr7dude".
I then ordered the relay from Allied, because I was placing an order
with them. These went into the TR-4 I've been recently working on,
and they work great.

Yep - that's similar to my suggestion. I try to avoid removing any metal from a chassis: someday, someone may want to return the set to original condition. As long as there's a way to make a change without grinding/filing/hacking, and it works, I go with that way.

From: ko4bg
Topic: 12884 Message: 12884

Hello, I hope this is not the wrong way to go about this if so I apologize.
I am looking for a Nice C line. Anyone have one that is in Very Good Condition both in Appearance and Operational. If so please give me a call at 256 462 3580 or drop me a note at ko4bg1atgmail.com
I can arrange pick up at the Dayton Hamvention. Or we can arrange shipping.
Thanks
Woody "KO4BG"

Hi Garey
Just wanted say I've been spoiled by your nice Drake service CD's which I purchased from you about a year ago. I recently picked up a basket case Johnson Viking Range which I'm in the process of bringing back to life. I found the the manuals which were available to be good, but lacked the photo detail that your CD's provide, so I asked around for anyone who might have some high res photos of the component side and received nothing but grief from people Geez those Johnson guys sure are snobs about a rig that's not even all that good. Anyway looking forward to your next edition Drake CD's two thumbs up....

Dave,
It's not just the Johnson guys who tend towards being "snobs". I'll leave off names, but some folks, down right get their "panties in a bunch", if threads go even slightly off topic.
The moderators here, should be the example of how every reflector, should be moderated.
I, too, wish that some enterprising person, would follow Garey's lead, and come out, with similar discs, for not just Johnson, but other classic old brands, as well.
We are fortunate, to have so many really smart, and eminently helpful folks, populating this reflector.

Dan

That government is best, which governs the least, because its people discipline themselves.

Grief over photos? I can't imagine that. As part of my "travels", I've started photo documenting interesting pieces of equipment that come across my bench. Including Drake stuff, of course. Sorry, no Johnsons (yet). Maybe someday I'll publish for money, but in the meantime I'll send them to whoever might need something.

I agree that Garey does a great job with the group.

I'll second that, Dan, and these groups are an integral part of the enjoyment of these radios.

One of the other nice things about this reflector in particular is how we can have differences of opinion (Sherwood mods come immediately to mind) and still be mostly civil about it. Such is not the case on many reflectors.

I'll continue to read, post and enjoy everyone's company on here...

Dave,
It's not just the Johnson guys who tend towards being "snobs". I'll leave off names, but some folks, down right get their "panties in a bunch", if threads go even slightly off topic.
The moderators here, should be the example of how every reflector, should be moderated.
I, too, wish that some enterprising person, would follow Garey's lead, and come out, with similar discs, for not just Johnson, but other classic old brands, as well.
We are fortunate, to have so many really smart, and eminently helpful folks, populating this reflector.

From: Dan Galligan
Topic: 12886 Message: 12890

Steve/Richard,
Again, I don't wish to sound as if I am bashing any particular group's reflector, so, I'll leave out specific group names. They are ALL generally helpful, some more than others. But, as helpful as they may be, they sometimes seem petty, or curt, when the moderator will demand an "End of thread", or comment in a snarky tone, how it is not a reflector for (insert the off-topic here), on an otherwise interesting and informative topic.
Whereas, around here, we seem to "get it", that we are generally all ham radio operators. As such, we enjoy talking about things, and as is human nature, topics, can, and frequently do, go off in a tangential manner. I have rarely seen the moderators here, tell folks that a discussion has gone too far off topic, and things need to wrap up. But, when I have seen it, it is always done, with courtesy, and it was the right thing to do at the time.
Last week, I had an off-list discussion, with the "head man in charge" on the list, to which I am reflecting upon. While he was very forthcoming, honest and courteous, he could not see my point, and informed me, that the reflector, represented the wishes of the board, and would continue to do the same. That, will not keep me from using it, but at least, I will not get frustrated, when the moderator puts a stop, to a thread that I find very interesting. I know how and why, they do, what they do, and while I may disagree, with the policy, it's THEIR reflector, and they can run it as they please. I am certain that the "powers that be", over there, would never stoop so low, as to sign up here, and see how a successful reflector, with reasoned moderation, is able to keep most of the people, happy, most of the time.
Look, I am new to learning about these wonderful old radios, and electronics, in general. So, it could accurately be said that I am here as a student, and you all, (on the various reflectors, of which I subscribe) are the teachers. So maybe I am a bit skewed. When things do go OT, I am still learning something, that I likely need to learn, and for me, that is a very good thing.
So, yes, this is a very long way of explaining how much I appreciate moderators, who do a FINE job, that is very thankless, for the most part. We have a golden group, here, and one I am very grateful, for it's existence, and for the wealth of knowledge, among people, so willing to share that knowledge, for the good of the hobby.

12893. My non-working TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-30 00:39:36 UTC
From: Howard Traxler
Topic: 12538 Message: 12893

Thanks Garey, for the encouragement. I did take off the final cage (4 screws and 2 shafts) and the protection lamp shows close to 0 ohms. I think that means it's OK. I'd sure like to clean the dust off of those finals. It must be 1/16" thick and sure smells when they start to get warm.

Yes, (Got the XYL to take a look) when I key the PTT I was getting 100ma (I think that's what the 1 on the meter indicates). I set the bias down a bit so I'm now getting abut 150. I think that's what the mark between the 1 and 2 is for.

Seems like I must be losing signal at an RF or mixer stage. What can I check next.

Thank you very much for your suggestions. I sure hope I can get this one working without sending it away.

Thanks and 73,
de
Howard, WA9RYF

Howard -

OK.

The 9.00 MHz is good, and 'should' be heard on all bands. That is the Carrier Oscillator. When you switch to CW or AM, it is 'moved' about 1 kHz lower in frequency.

The 21.5 MHz is good, and 'should' be heard only on 40M. That is the Heterodyne Oscillator. It will be different for each band.

When the PTO is tuned to the '000' point, it should be heard at 5 MHz. This is a tunable oscillator, and so may be a few kHz, (up to 10,) either side of this frequency.

The final cage isn't that hard to remove, the TUNE and LOAD shafts just pull out of the couplers that go through the side, and then remove the small screws. Obviously power off and power supply unplugged.

You didn't answer whether you had PA Bias current when you closed the PTTas described in Section 4, para A in the manual.

> > > Well, there are two locations for the bulb and my old brain forgets which one is which. One of the TR4's it is under the chassis, near the antenna connector and relay, the other one is in the final compartment. Look closely in that area very near the antenna connector and you will see it plugged into a socket. The contacts are most suspect, unless you had a transmitter too close and blew the bulb.

From: Garey Barrell
Topic: 12538 Message: 12894

Howard -

First, the BIAS should be set for 0.1A, not 1.5A! The idle current
should be set to 0.1A.

Listening on a separate receiver, can you HEAR a signal on 40M when
you key the transmitter, even a very weak one.

Using your external receiver with a little sample loop for an antenna,
put the loop near V4 and see if you can hear a 7.000 MHz signal with
the PTO of the TR-4 set to 000. This would be in TUNE mode, -x on the
SIDEBAND switch. If you can, see if it's stronger at V6. Keep an eye
on the PLATE meter to make sure the plate current doesn't jump up
during this test.

12895. RV7 Dial Mechanism Question

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-30 19:45:02 UTC
From: w9dz
Topic: 12895 Message: 12895

I recently obtained an RV7 that was advertised on QTH.COM. It looks good and it's electrical operation is fine.

My problem is with the inner-most circular dial. When the the 'OO' on the outer dial is aligned over the index mark I am rougly half way between 100 KHz marks on the inner dial. Calibration on the outer dial seems to be OK.

I have removed the case to take a look but really can't see much and don't want to start taking things apart running the risk of not getting it back together correctly (that happens to me sometimes!).

Is the inner dial held with a set screw? Anyone here tackled this before?

Thanks

Allen, W9DZ

Look at the bottom picture on this page:

http://www.wb4hfn.com/DRAKE/DrakeArticles/InsideTheTR7/Inside_The_TR7-04.htm

You will see a spring loaded metal arm with an adjusting screw that rests against the lower portion of the frame. Pushing the top of the arm towards the center of the PTO assembly will release the idler gear so one of the dials may be moved without moving anyting else. If this doesn't get you where you need to be, further surgery will be required.

12899. Mostly working TR-3

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-31 11:54:29 UTC
From: Fraser
Topic: 12899 Message: 12899

Spent the weekend's WPX putting my "new to me" TR-3 through it's paces.

First the good news, I made a bunch of Stateside and DX contacts on 15, 20, 40 and 80.

On 10, I can transmit and get power, but there's nothing on receive. A few big signals on my Icom, but nothing at all on the TR-3. No CAL signal but CAL does work on all bands except the three 10m band positions.

Would this be a band switch issue, or are the 10m crystals dead?

12900. No good output with my new (old) TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-31 13:02:43 UTC
From: claudewelsch
Topic: 12900 Message: 12900

I just got a TR-4 on ebay and have some problems with tuning in. The receiver part seems to work decent but transmitter output is erratic: On 40 and 80 m I have near 0W, plate current goes over 0.6A but PLATE and LOAD controls don't react, just XMIT gain and TUNE.
On another receiver, I can hear the signal on 80 m resp. 40 m.
On 20m I have 30W on my power meter, I hear the signal on 20 m but I have another signal, much much stronger on 2x frequncy, i.e. 10m. The PLATE has a dip corresponding to max. output.
On 15 m output is near OW, plate current is max. 0.2 A and no reaction on PLATE and LOAD control.
On 10 m I get 100 W output with a PLATE control at 3 and a LOAD at 2, RF GAIN fully counter clockwise! with a plate current going immediately up to 500 ma.
What is wrong here?
Does anybody know?
Happy Easter!

Fraser -

Certainly could be a bandswitch issue. Check contacts around the BAND oscillator as that's the only thing I can think of that would affect only ONE band.

Have you tried adjusting L2? L3 and L4 are 'incremental' coils, tiny little air-wound coils between the switch fixed contact terminals. Make sure L3 and L4 haven't been damaged. Meter on the TP and adjust L2 to see if you can get any negative voltage. Possibly weak V1. I doubt seriously that all three 10M crystals are defective.

12904. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-31 16:46:51 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 12904

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

Claude, in addition to the other suggestions (and given my recent experience bringing my TR-4 back to life) I would suggest giving all the various contacts (switches, tubes and sockets, crystals, etc.) a contact cleaner treatment. Mine had all manner of strange problems "corrected" by thoroughly cleaning the tubes and sockets.

Thanks for the tip! That's the first thing I did, but if you read well, this doesn't work here!

I found a solution!

In fact I have a T-4X around that does correctly tune in. So I took a closer look at the T-4X. There the solder joints at L8 and going to the resistors/selfs to the three finals' plates as well as the solder joints on L9 and C95, the LOAD capacitor, had been recenly redone.
I decided to do the same, removing the cage completely as well as the screws fixing L9 and completely renewed all the solder joints.
Now tuning works great, with plenty of power, on all bands!

The thing I found, in my case, was not the bandswitch which needed cleaning but the tube pins and sockets.

Although, it is good to hear doing the solder joints over seems to have fixed your problem.

Claude -

Are you able to set the PA IDLE current per the instructions in
Section IV. Para. A of the manual?

It sounds like the PA is oscillating on 10M where you are getting 100W
and 600 mA of plate current.

If you haven't already, go through and check all screws to ensure they
are tight, especially tube socket, terminal strip, and shield hardware.

Are all tubes heating properly?

If still a problem, I would strongly suggest disconnecting the PA
Screen supply. The terminal is across from the filament fuse. There
are a group of five terminals through the PA underchassis shield. The
first one of the groupfrom the rear wall of the chassis, is the +650
VDC, the second one is the Screen supply. This one needs to be
disconnected CAREFULLY. Be sure and remove solder and do not apply
any side stress on the ceramic feedthrough capacitor as they WILL
crack. Once this is done, you can key the transmitter and work on all
stages without damaging the PA tubes with too much current.

If the receiver is working correctly on all bands, all but V4 and V6
are 'almost' eliminated as the source of trouble. Voltage checks of
these stages will eliminate DC problems.

Garey,

For 40 and 15, I can peak L1 and L5 for max negative voltage. When I switch to 10m, the voltage flips to positive ???

You need to go back to the day they were made and seal 8 of them behind
a brick wall in a dry basement in Paris. :-)

(If you are a Doctor Who fan, you get it and if not, I apologize).

Geoff.

Fraser -

That just means the oscillator is not running. Have you subbed the tube? If you don't have another, swap with V3. If no help, swap back.

I would check with an ohmmeter between all the switch tags for the 10M crystals, (the ones with the incremental coils,) to makesure there is 0 ohms from one end to the other. Check L2 and make sure it's not open.

Assuming adjusting L2 has NO effectI would then take each crystal and plug into the third 10M socket one at a timeand see if you get any negative voltage. The TP is at RF ground, so the type of meter shouldn't have any effect.

If you have another crystal anywhere near40 - 50 MHz you could try it just to confirm. The 35.5 crystal 'MIGHT' work, but probably not. If you can borrow a crystal from someone with a TR-3 or 4. It's certainly possible, but I just can't think all three crystals are bad....

Last resort is C1 / C2 if one isleaky or off value it may have disturbed the division ratioat the high end.

Last, last resort is order a new crystal from International Crystal Mfrs and see what happens!

I think that's wishful thinking. That doesn't mean some nut out there
with more money than brains won'tpay it, look at unbuilt Heathkits!
:-) Maybe someone will buy it and put it in storage without opening it!!!

It's not all that big a deal. Not really similar to a 1977 car with
50 miles on it, cause the receiver doesn't physically deteriorate
mechanically like a car, and is certainly a LOT cheaper to 'renew'.
But the biggest thing is there are still dozens ? hundreds ?
thousands? still out there that are in effectively unmolested'mint'
condition. Now if it was a 1-A.........

Garey,

I started swapping V1 for some other 6EA8's that I had and finally got some negative voltage, and I can tweak it with L2.

I noticed some intermittent voltages as I wobbled the tube, so I think I will need to tighten up the pins.

Thanks for the hints.

Fraser

Garey
there is a" decent" condition tempo 2020 for 1500.00 , not even new in the box. Hope he does not sell to a friend for that price.

I think that's wishful thinking. That doesn't mean some nut out there
with more money than brains won'tpay it, look at unbuilt Heathkits!
:-) Maybe someone will buy it and put it in storage without opening it!!!

It's not all that big a deal. Not really similar to a 1977 car with
50 miles on it, cause the receiver doesn't physically deteriorate
mechanically like a car, and is certainly a LOT cheaper to 'renew'.
But the biggest thing is there are still dozens ? hundreds ?
thousands? still out there that are in effectively unmolested'mint'
condition. Now if it was a 1-A.........

12925. Drake TR-3 with mobile and base power supply/

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-02 00:37:30 UTC
From: w0szv
Topic: 12925 Message: 12925

Fellow members, I need to know what the worth is on a working TR-3 with a working base power supply and a unknown condition mobile power supply. the TR-3 has just had a capacitor kit put in it and is working. It is excess to my needs and I don't want to overprice it or just give it away to someone trying to lowball it. any responses should be by my e-mail and not by the reflector to keep from jamming it up with a lot of unneeded info.
thanks
Eldon Scott

Thank you Garey for the detailed instructions.

As I said I resoldered all the final self and capacitor joints and this did the job!

Topic: 12900 Message: 12927

Hello Garey,

I have two further problems with my TR-4, maybe you can help:

1) On 40m, the transmit signal is 30 kHz off the dial and the received frequency. When I'im receiving at 7,200 MHz, I am transmitting at 7,1700 MHz. I checked on the schematics and there is no crystal for the 40m band!

2) The Sideband is not correct on all bands. I can of course switch with the Sideband switch, but should it not be automatically right.
With the Sideband switch on the left position i have:
80 m LOWER correct
40 m UPPER NOT correct
20 m LOWER NOT correct
15 m UPPER correct
10 m UPPER correct
10 m UPPER correct
10 m UPPER correct

Shall I invert the solder connections for S1A FRONT and REAR switch for 40m and 20m?

At some point someone has to open it, right? That would be an exciting moment for most any Drake collector.

An R-4C sitting in an unopened box may actually need more TLC than a unit that receives periodic use. PTO race bearing grease will have dried and congealed in the last 40 years of complete non-use. Band switch wafers may need cleaning/lubrication with DeOxit. So, the excitement from the "out-of-the-box-experience" might be a bit dampened once the unit is pugged in and operating.

12932. Frequency shift R to T in TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-02 15:52:55 UTC
From: Garey Barrell
Topic: 12900 Message: 12932

Claude -

OK. I guess I missed your 'fixed' message! Glad you have it going.

Your 40M problem is vexing! There IS a crystal (21.5 MHz) for 40M.
21.5 MHz - (9 MHz [CO] + 5.5 MHz [PTO] = 14.5 MHz) = 7.0 MHz. Nothing
should change from receiveto transmit. Possibly a spurious output
from the crystal? I'm at a loss, perhaps someone else will have an idea??

I don't know if your sideband reversal is related to the above
somehow, but it certainly is suspicious. My initial reaction would be
to leave the switch wiring alone, unless it shows evidence of being
'adjusted' by a previous owner. I would say that is highly unlikely.

There may be some connection with the fact that the LO is at 14.5
MHz..... I wonder if the transmit mixer has been mistuned to the LO
rather than 40M. So the receivemixer is tuned properly, but the
transmit mixer is not. Check the transmit mixer alignment relative to
40M for starters and let us know what you find.

Ok, Garey. I'll check this in the evening. Ok, there is a crystal for 40 m, just none for 80 m and 20 m. The position of the switch in the schematics is a bit misleading, so I didn't see this at first.
Is there a guide for the abbreviations somewhere (CO, PTO, LO) ?

This is the same as my TR-4, and I believe my TR-3 as well; although I haven't used my TR-3 for a while and I'm rebuilding the AC-3 at the moment.

As far as I know (and understand) the Sideband switch doesn't really have defined settings. In other words, left is not LSB and right is not USB. The sideband used is indicated by the Upper and Lower panel lights, and the selection is by the Sideband switch.

The TR-4 manual indicates this as well (on page 21; Operation) where it says the Sideband control should be "On the desired sideband as shown by the indicator lights."

So I would say your switching is correct, but I have no idea why this was done instead of having one Sideband switch setting be LSB and the other be USB.

> Is there a guide for the abbreviations somewhere (CO, PTO, LO) ?

I seem to recall having first seen definitions for these in "older" amateur radio handbooks (pick your favorite :-) I started using them from the late 1950s. (I learned a lot from my father's 1959 ARRL handbook.) I believe you will find:

CO = Carrier Oscillator
PTO = Permeability Tuned Oscillator
LO = Local Oscillator

CO= carrier oscillator
LO= local oscillator
PTO= your "VFO", which is technically not. PTO= Permeability Tune Oscillator. You are moving a slug thus changing inductance, not a capacitor like in a VFO.

I am reminded of two short stories, the details of
neither can I remember. Similar plots: A convoluted murder
it done to obtain a hidden treasure. In one case, a supply
of rare wine, in the other the loot from a big bank job. In
the first the wine turns out to have turned to vinegar, in
the second the money is in "old", i.e., pre-1933 bills and
worthless. Someone may connect these to the stories. I
think the one about the money may have been used in a radio
script (giving away my age).
A test I always applied to presents is to shake the box
to see if it rattles. Non-rattling boxes generally
contained clothes and were not interesting at the time. Of
course later, clothes were quite interesting and
appreciated.

I used to have a fantasy of finding something like a
1928 Packard Twin Six roadster in a barn in nearly perfect
condition. No skeletons chained to the seats either.

Just in general, Drake schematics (and they are not
alone) look like a map of the Southern Pacific freight yard.
I get schematics like this printed large and trace wiring
with a colored pencil or highlighter. That keeps my eyes
from getting lost. Its sometimes helpful to re-draw parts
of a schematic in simplified form. Almost always schematics
of multiple pole switches are confusing to follow.
The schematics in Garrey's discs can be printed up to
map size.

Claude -

I screwed up that conversion scheme. The actual mix is BAND Osc (21.5 MHz) - PTO (5.5 MHz) = 16 MHz in Mixer V1, then LO (16 MHz) - CO (9 MHz) = 7 MHz in Mixer V4. I hope I haven't confused you more! :-)
Also thanks to those who explained my abbreviations.

I believe this also debunks my theory for the R / T frequency shift, which was weak at best. That one really has me stumped. ANYBODY HELP!?!?!

Someone else answered the 'wrong' sideband question. Because of the mixing scheme, some bands have the sideband inverted while others do not, depending upon the frequencies involved. The USB / LSB lights denote which sideband is being transmitted.

The lightsare necessary because Mixer V4 inverts the sideband on 80M but does not invert on all the other bands. So if you select the USB filter you'll be in USB on 40, 20, 15 and 10M. Since you want LSB on 40, you have to change the filterto the LSB filter. If you select the LSB filter you have LSB on 40, 20, 15 and 10M so you have to change the filter to the USB for all but 40M. Lastly to get LSB on 80M you have to again select the USB filter which makes everything right from 20M and up. Very confusing.

Mark -

Thanks for clearing that up. I didn't do a very good job of explaining the SIDEBAND switching. The reason it works that way is because the sideband is inverted in the Mixer (V4) which inverts the sideband coming from the BMon 80M ONLY. So if you select the USB filter you'll be in USB on 40, 20, 15 and 10M. Since you want LSB on 40, you have to change the filter to the LSB filter. If you select the LSB filter you have LSB on 40, 20, 15 and 10M so you have to change the filter to the USB for all but 40M. Lastly to get LSB on 80M you have to again select the USB filter which makes everything right from 20M and up.

Hi Garey,

The error was on my side! I don't know why I was convinced that the receive frequency was right and the TX 30 kHz off (probably because nobody ever answered me when I called on 40m...) but the RX frequency is off too! I just used my other transceiver to send and I found the truth!
I guess it's the crystal then. Does anybody know a good source for crystals. I asked Jan Crystals and one crystal costs me 45$ and 6 weeks time. I remember the good old time when crystals were available at every corner for 1$.

Sorry for the mistake.

The correct schematic would have the number 966727000 at the bottom
just below the title. What is the number on the schematic you have?
There are eight different versions of the TR-4. Yours is version 4.

I believewhat Mark said is true. I haven't used my TR-4C for a year
or so, and only CW so always use the '-X' position!!!

The best sourcefor crystals is International Crystal Mfrs
<www.icmfg.com>. Should be only about $25 plus whatever additional
postage to you. They have all the Drake information and only know
which crystal (frequency) for which radio to getyou the correct one.
AND it WILL be on frequency!

12948. R-4 and T4X Station

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-02 20:56:18 UTC
From: Don Cunningham
Topic: 12948 Message: 12948

Since we have had a thread on "near mint" rigs lately, I got to thinking that I should offer a set I bought the other day before I get into them very much. I have a nice, complete early set of Drakes from 1965, by the QC tags on the receiver and transmitter. It came from the estate of Jim Brooks, W5PYH, an IBM employee in the Oklahoma City area. It has NOT been fired up since coming from Jim's station, and the friend of mine that bought it last year didn't want the set, he was just helping the widow "get rid of" all the stuff.

I am curious if anyone is interested in the set, consisting of:

R-4 s/n 0678, QC tag dated 3/1/65 Excellent condition with the exception of the top cover. Apparently, in a move, it took a real shock on the top, damaging it slightly in 3 or 4 places. Hard to see in pictures, but it is there. VERY minimal corrosion on the top of the chassis, one of the best I have ever seen. Again, shiny and hard to see in photos, but there.

T-4X s/n 10441, QC tag dated 26/10/5 which coorelates to October 26, 1965. Excellent condition also, with VERY minimal pitting on the chassis top. Again hard to see in photos as it is so nice and shiny.

AC-3 s/n 18731 and MS-3 (no tag on front grille and not as deep as the MS-4) both in VERY nice, original shape.

Downsides: the cover on the R-4. Looks so nice that my friend hadn't even noticed the damage. The SK was a technician (or engineer, I really didn't know him) and worked on his own gear. The can capacitors in both the R-4 and T-4X have been bridged under the chassis with modern caps. NO other mods/repair noted during my inspection. The T-4X manual is a reprint, and the R-4 manual although original has an earlier s/n on the cover, so didn't come with this rig. Schematic is of the right vintage in the case of the R-4, not sure of the reprint.

For pricing, I would consider about what WB4HFN shows on his resale charts as "average", $425 picked up in Southwestern Oklahoma. If you insist on shipping it, it would have to ship in 4 boxes, and I could take it to a private shipper I have used as he packs well. All packing/shipping is your responsibility. I would get pricing first, as it will not be cheap, but it will arrive well packed and not damaged any further.

If no interest on the list at that price, I'll advertise elsewhere or refurb it and build another shelf, HI. I am being honest as I can, and have a NUMBER of pictures I would share with a serious buyer. This is one of the nicest sets I have seen in many years of fooling with these old Drakes, so if you want a nice example of this vintage rig, let me know. I found in some other stuff I bought from that estate an 8" x 10" color shot of this station in Jim's shack years ago.

BTW, I did share the s/n data with WB4HFN.
73,
Don, WB5HAK

From: w1kilofoxtrot
Topic: 12900 Message: 12949

Just for my own sake of clarity, let me comment:

A PTO -is- a VFO, since it is an oscillator whose output frequency can be varied.

A VFO may be a PTO, or a capacitor tuned, or varactor tuned, or even DDS (direct digital synthesis) oscillator.

Generally speaking, VFO is the most generic term, and applies to all of the different ways we tune an oscillator, with the exception of a crystal oscillator that can be 'pulled' in frequency, and thus varied, but not by much.

Does that make any sense?

I want to have:

USB on 10m, 15m and 20m, LSB on 40m and 80m.

This should be possible to do it automatically with the help of the bandswitch.

There is a position of the Bandswitch to do this, but it is done incorrectly on 20m and 40m. Is there a historical reason for this ?

Dear Garey,

I have on original manual although a bit in pieces but I don't see any numbers below the title SCHEMATIC DIAGRAM - MODEL TR-4 TRANSCEIVER.

Steve -

I supposethat's correct... :-) Once upon a time, ALL 'VFOs' WERE VFOs, an LC circuit with a variable capacitor. Their frequency was NOT linear over it's range because of the 'One over two Pi fc' resonant frequency. Then came the PermeabilityTunedOsc ('PTO') or Linear Master Osc) ('LMO') which was an LC circuit with a variable inductor, which could be wound to be MUCH more linear over the range. Various techniques were applied to make linearity even better and eventually we got almost perfect linearity from one end to the other. Then we hadPhase Locked Loop (PLL) circuits which essentially gave 'perfect' linearity, but required considerable circuitry and inherently had noise along with the output signal. The varactor Varactor Tuned Osc (VTO) also allowed some 'VFOs' to be built and linearized by shaping the DC voltage applied. And now we have had several generations of Direct Digital Synthesis (DDS) oscillators which literally 'build' the RF signal one bit at a time.There are probably more, but that's all I can recall. I'm sure there are others under development that we haven't seen yet!

All of the Drake 4 Line and 7 Line radios use PTOs.

So yeah, they're ALL VFO's (Variable Frequency Oscillator) but the improved operation of the later 'versions' deserve a little recognition! :-)

Claude -

Itis NOT possible for the TR-4 because of the mixing scheme. The SSB
is generated at 9 MHz. Either Upper or Lower sideband is selectedat
this frequency. The resultant signal is mixed in (V4) which inverts
the sideband on all but 80M. LSB in, USB out. Or, USB in, LSB out.
There is no 'historical' reason, it's just a fact of the design used.
'Modern'radios get around this by switching things around with tiny
relays that weren't available in 1963.

So you have to use the USB filter on 80M in order to get LSB out.
Inverted.

You have to use the LSB filter on 40M in order to get LSB out. No
inversion.

You have to use the USB filter on 20, 15 and 10M to get USB out. No
inversion.

So the USB filter could be used on all BUT 40M.

In 1966 I went to Collins in Cedar Rapids on a military contract.

Because I was a ham I was introduced to the tech that tuned the PTOs.

He was blind. He used a disk with holes in it on the shaft and for each position he would tweak the coil. At that time every PTO produced there was adjusted the same way by the same person.

He had JOB SECURTIY! At least until PLLs took over.

Steve -

I supposethat's correct... :-) Once upon a time, ALL 'VFOs' WERE VFOs, an LC circuit with a variable capacitor. Their frequency was NOT linear over it's range because of the 'One over two Pi fc' resonant frequency. Then came the PermeabilityTunedOsc ('PTO') or Linear Master Osc) ('LMO') which was an LC circuit with a variable inductor, which could be wound to be MUCH more linear over the range. Various techniques were applied to make linearity even better and eventually we got almost perfect linearity from one end to the other. Then we hadPhase Locked Loop (PLL) circuits which essentially gave 'perfect' linearity, but required considerable circuitry and inherently had noise along with the output signal. The varactor Varactor Tuned Osc (VTO) also allowed some 'VFOs' to be built and linearized by shaping the DC voltage applied. And now we have had several generations of Direct Digital Synthesis (DDS) oscillators which literally 'build' the RF signal one bit at a time.There are probably more, but that's all I can recall. I'm sure there are others under development that we haven't seen yet!

All of the Drake 4 Line and 7 Line radios use PTOs.

So yeah, they're ALL VFO's (Variable Frequency Oscillator) but the improved operation of the later 'versions' deserve a little recognition! :-)

They must have built a lot of R-4's in March of '65. Mine's s/n 936 and its tag is dated 3/17/65.

Subject: [DrakeRadio] R-4 and T4X Station

Since we have had a thread on "near mint" rigs lately, I got to thinking that I should offer a set I bought the other day before I get into them very much. I have a nice, complete early set of Drakes from 1965, by the QC tags on the receiver and transmitter. It came from the estate of Jim Brooks, W5PYH, an IBM employee in the Oklahoma City area. It has NOT been fired up since coming from Jim's station, and the friend of mine that bought it last year didn't want the set, he was just helping the widow "get rid of" all the stuff.

I am curious if anyone is interested in the set, consisting of:

R-4 s/n 0678, QC tag dated 3/1/65 Excellent condition with the exception of the top cover. Apparently, in a move, it took a real shock on the top, damaging it slightly in 3 or 4 places. Hard to see in pictures, but it is there. VERY minimal corrosion on the top of the chassis, one of the best I have ever seen. Again, shiny and hard to see in photos, but there.

T-4X s/n 10441, QC tag dated 26/10/5 which coorelates to October 26, 1965. Excellent condition also, with VERY minimal pitting on the chassis top. Again hard to see in photos as it is so nice and shiny.

AC-3 s/n 18731 and MS-3 (no tag on front grille and not as deep as the MS-4) both in VERY nice, original shape.

Downsides: the cover on the R-4. Looks so nice that my friend hadn't even noticed the damage. The SK was a technician (or engineer, I really didn't know him) and worked on his own gear. The can capacitors in both the R-4 and T-4X have been bridged under the chassis with modern caps. NO other mods/repair noted during my inspection. The T-4X manual is a reprint, and the R-4 manual although original has an earlier s/n on the cover, so didn't come with this rig. Schematic is of the right vintage in the case of the R-4, not sure of the reprint.

For pricing, I would consider about what WB4HFN shows on his resale charts as "average", $425 picked up in Southwestern Oklahoma. If you insist on shipping it, it would have to ship in 4 boxes, and I could take it to a private shipper I have used as he packs well. All packing/shipping is your responsibility. I would get pricing first, as it will not be cheap, but it will arrive well packed and not damaged any further.

If no interest on the list at that price, I'll advertise elsewhere or refurb it and build another shelf, HI. I am being honest as I can, and have a NUMBER of pictures I would share with a serious buyer. This is one of the nicest sets I have seen in many years of fooling with these old Drakes, so if you want a nice example of this vintage rig, let me know. I found in some other stuff I bought from that estate an 8" x 10" color shot of this station in Jim's shack years ago.

BTW, I did share the s/n data with WB4HFN.

Topic: 12948 Message: 12958

I agree, that doesn't sound possible, Steve. Mine is definitely dated March 1, 1965, with serial number penned in the same hand. Ron has no R-4's on his list at all, so no way to check it with his list. The T-4X did check in the same time frame as the closest on Ron's list.

I don't know how to tell which is correct, mine or yours, but there does seem to be a discrepancy.

Topic: 12900 Message: 12959

Oops – thought this was TR-4C for some reason. There are no dial levers – just friction fit – but the idea is the same. Hold the dial and rotate the knob until the indicated frequency is on a known frequency from another source like a signal generator. That assumes that the frequency is off 30 khz on ALL bands.

Claude:

Been following this thread through but may have missed something....

Are you SURE you're off 30 Khz on 40m ONLY? I don't recall seeing anywhere where you said specifically it was "on frequency" on the other bands.

If it's off 30 Khz on the other bands as well, and remember the bands dial different directions on 80 and 20m (if memory serves me right - I know, I know, I should go and look at one!), then the fix is easy – just reset the dials using the dial release levers to a known frequency.
Just seems hard to believe the xtal is off by 30 Khz!

Different story altogether IF it is off ONLY on 40m.

Subject: [DrakeRadio] Re: Frequency shift R to T in TR-4

Hi Garey,

The error was on my side! I don't know why I was convinced that the receive frequency was right and the TX 30 kHz off (probably because nobody ever answered me when I called on 40m...) but the RX frequency is off too! I just used my other transceiver to send and I found the truth!
I guess it's the crystal then. Does anybody know a good source for crystals. I asked Jan Crystals and one crystal costs me 45$ and 6 weeks time. I remember the good old time when crystals were available at every corner for 1$.

Sorry for the mistake.

Dear Claude

Send an email to vincentvoy@... or call +44 208 393 0545

He has a small ad in the RSGB magazine every month and also sells "standard" crystals on eBay (like 10MHz etc) which I have bought from him

He is in UK, near London and makes crystals to order at a lot less than $45. He knows the Drake specs too.

I also bought NEW Drake band crystals from him for the WARC bands for a 4 line at FAR less than eBay sellers of years old used in the US!

No import taxes on goods sent form UK to LUX either!

From: claudewelsch
Topic: 12900 Message: 12963

It is off on 40m only, it's certainly the crystal...

Hmm, after what you say, the 40m would be the only one that's wrong.
So why is 20m also wrong (see my list)?

Topic: 12965 Message: 12965

The xtal calibrator on my R-4B started acting intermittently and seemed to emit the signal at weird frequencies. Ultimately, it quit working. Any help would be appreciated. TNX, Fred

Yours definitely has a lower number, so it's conceivable that they did test hundreds of units in a nearly three-week period. Given that this was a new model that was drastically different from the 2B that it replaced, I'm sure they had some queued up and waiting!

I've noticed, too, that Ron does not have the R-4 on his list but he did acknowledge my contribution of serial number to him.

BTW, performance-wise, my R-4 seems to be just as good as the R-4A and R-4B currently in my shack. I observe that the PTO seems to be a lot more stable than I anticipated, given that it's a tube version. The vernier drive preselector that was added later is certainly a nice touch but I have no problem peaking the preselector without it.

Fred -

If you have a scope, check the output to see what you've got. There should be a square-wave signal at 25 kHz.

Crystals do go bad sometimes, so if there's no output coming into the IC and the transistor seems to have normal junction readings on a DMM, I'd look at that. The crystal is a common 100 kHz unit and there are lots of them available on eBay and elsewhere.

Good luck...

Don:

Based on you original post it looks like the date format Drake used on the QC tags at the time was dd/mm/yy, or dd/mm/y in the T-4X case, and with the R-4 stated as 3/1/65 per your 1st post, that translates to January 3, 65, not March 1, 65. Looks like there is almost 3 months, not 3 weeks, between the inspection dates on your new find and Steve's.

It probably depended upon who did the final test. Everything I've seen from Drake was in the 'US' mm/dd/yy format. It's certainly possible thoughthat a military or European person did some of the final test.

The R-4 wasn't really shipped until early 1965. The first schematic I have is dated Oct 1964, but was 'Preliminary'. The first 'almost official' schematic was dated 2/7/65. Perhaps production was begun, important changes were made and shipping was halted, and those still on hand were 'updated'. Strictly a guess, but feasible.

According to MY list, s/n 936 had a QC Date of 3/17/65, so there were a bunch shipped in March.

Interesting subject to me as FWIW I have R4 # 270 (sorry no cardboard for build)

Carry your thought a step further. Dayton Hamvention was in April back then. Drake had the corner booth where Icom has been for the last few years. They would have also shipped to dealers??

Yep - that's my R-4 (936). First Drake set I've ever owned that had its original tag. It also has an Allied tag.

It's in near-mint condition and has the speaker that was bought with it.

Could have been a different person, but mine is "3/17/65"

That would indicate traditional American date format.

Don:

Based on you original post it looks like the date format Drake used on the QC tags at the time was dd/mm/yy, or dd/mm/y in the T-4X case, and with the R-4 stated as 3/1/65 per your 1st post, that translates to January 3, 65, not March 1, 65. Looks like there is almost 3 months, not 3 weeks, between the inspection dates on your new find and Steve’s.

Yours definitely has a lower number, so it's conceivable that they did test hundreds of units in a nearly three-week period. Given that this was a new model that was drastically different from the 2B that it replaced, I'm sure they had some queued up and waiting!

I've noticed, too, that Ron does not have the R-4 on his list but he did acknowledge my contribution of serial number to him.

BTW, performance-wise, my R-4 seems to be just as good as the R-4A and R-4B currently in my shack. I observe that the PTO seems to be a lot more stable than I anticipated, given that it's a tube version. The vernier drive preselector that was added later is certainly a nice touch but I have no problem peaking the preselector without it.

I just received another R-4B with a non-working calibrator - or so it seems.

The set is in very good shape, cosmetically and only has this fault, dirty bandswitch and some AC on the audio. Should be an easy rehab. Ordering a re-cap kit shortly.

I'll post what I find with the calibrator.

12975. TR-4 output

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-04 01:09:33 UTC
From: Steve Wedge
Topic: 12975 Message: 12975

It seems the neutralisation is off on a recently-received TR-4. I can get barely 20W out on 10, but over 200W on 40. Max output definitely not coincidental with the plate dip, even on 20.

Receive on 10 seems very weak as well. I'm not ruling out someone having "played" with this one. This is the first TR-4 I've played with in a long time, so I'm expecting to learn some...

Can I rule out soft finals?

Steve-

If you're getting much morethan 200W on 40M I'd investigate your power measuring! Very rarely do they put out over 200W on any band.

What is your output on 15M. Soft finals usually cause 15 to dropsome at the same time. If ONLY 10M, probably just neutralization?

From: Steve Wedge
Topic: 12975 Message: 12978

Yep - after i posted this, realized I was on the wrong antenna. D'oh!

Looks like the finals are toast: only getting 120W on 40 and about the same on 20, with the xmit gain all the way up, CW mode, no key in jack. It takes over 500ma to get there. I don't doubt the neut is off as well and probably contributed to their demise.

15 is dead so I can't tell yet. I did receive for a few seconds and haven't been able to coax it back into receive yet. Receive on 10 is very weak - can barely hear the calibrator.

I suspect someone who shouldn't have, went through this rig with a tweaker.

This rig looks really nice, so it will be worth digging into.

While I have everyone's attention, who's got the best prices on 6JB6's these days who's also reliable?

Steve,
If you need the IC1 or IC2, they can still be obtained from:

http://semiconductormuseum.com/MuseumStore/MuseumStore_Fairchild_923_Index.htm

You might also try strapping it for 50kc instead of the normal 25kc to see if that works. It's a simple one wire jumper.

Regards,
Mark, WB0IQK

Claude -

It is NOT possible for the TR-4 because of the mixing scheme. The SSB is generated at 9 MHz. Either Upper or Lower sideband is selected at this frequency. The resultant signal is mixed in (V4) which inverts the sideband on 40, 15 & 10M. LSB in, USB out. Or, USB in, LSB out. There is no 'historical' reason, it's just a fact of the design used.

I believe the below information is correct. (Finally!) If someone has a TR-3/4 available, I'd appreciate a 'reality check'! It appears that the 'non -x' side is the true LSB filter.

You have to use the LSB filter on 80M in order to get LSB out. No inversion. [blank]

You have to use the USB filter on 40M in order to get LSB out. Inverted. [-x]

You have to use the USB filter on 20M to get USB out. No inversion. [-x]

You have to use the LSB filter on 15 & 10M to get USB out. Inverted. [blank]

Garey,

I have a TR-3 and you are correct about the Side Band filters. It makes one get confused the way they do it.

Tnx, Mark. I may need one, but I'm noticing in the manual that came with it that the PO may have disconnected the calibrator for some reason. It may be as simple as reconnecting a wire. I hope to find out shortly. If it turns out to be that simple, I'll only have to re-cap this one to get it up to snuff.

12987. Need 15m Crystal for TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-05 01:32:19 UTC
From: Steve Wedge
Topic: 12987 Message: 12987

It's good to have other Drake rigs around to swap parts into and out of.

My TR-4 is 100% dead on 15m. I took the crystal and put it into an auxiliary socket of one of my R-4B's and could not get it to peak anywhere. I took a crystal for 12m (35.6 MHz) from my R-4B and put it into the TR-4 and got peaking and signals. Of course, everything is off-frequency that way, but that verified that the band circuits are good and the XTAL is bad.

Does anyone have an extra TR-4 15m crystal they'd sell me for FMV? It's just easier than waiting for 9 - 5 and ordering by phone Otherwise, I'll go to ICM and order one. Nobody on eBay seems to have one at the moment...

Hello Garey,

I still have some oscillations on 10m so I went back to your recommendations. What do you mean by '...terminal strip, and shield hardware'?

The first ceramic feedthrough capacitor (650V) has already been replaced by a plastic tube. Is that any problem?

Claude -

Have you done the neutralization procedure from the manual?? The
hardware, typically sheet metal screws, that holds tube sockets,
terminal strips, metal shields between sections, etc. Many of the
terminal strips, sockets, etc. get their ground connections for the
strip, board, tubes, etc. These can loosen over time from heat/ cool
cycles and vibration, surfaces corrode, and therefore ground
connections get 'flaky'! Ensuring they are tight, and even if they are
loosening slightly can greatly improve grounding and therefore stability.

No, the 650VDC is too highfor the ceramic feedthroughs, so it gets
just an insulated tube.

Ok, I checked everything and it was tight. Can it be that a bad tube out of the three can cause oscillations? I tested the tubes in the T-4X and number 2 was definitely much weaker than number 1 and number 3.

That odd tube would bother me. Its worth replacing. If
you have a tester that measures Gm also called
transconductance, you can match tubes pretty well. The three
should be close. But also, they should be of the same make
if possible. There may be slight differences in the
structure of different makes of tubes of the same type which
can make neutralizing difficult.

I ordered new tubes and they are on their way. I just wanted to know if that can be the cause and I'll put the Drake TR-4 aside until I got new tubes, a new crystal and a new neon light. By the way I ordered a box of 10 Sylvania NE2-E, if someone need one, I can send it...

Hello Don,

I'd be interested in the station, if you find an inexpensive way to mail it to me (in France).

Regards

Claude

Claude -

A weak tube is a problem. The three are in parallel, and are run pretty well 'at their limit'. So if one is weak, theother two are driven PAST their 'limit' and distortion (spurious and harmonic) increase dramatically.

Drake sold 'matched' sets of tubes for about $9, but no more! :-) Tubes are matched not by 'gain', rather by current sharing. 'Matching' is done by setting one tube to 35 mA of idle current, then plugging in a second tube and without changing the BIAS voltage measure the idle current for THAT tube. I've never been able to locate an exact specification, but I believe their matched sets were within 5% of each other. Tubes in the transmitters are run at 35 mA each (70 mA total idle current), and in the transceivers at 33.3mA, but I think that's just a matter of meter markings. I aim for within 5% of absolute current, but more importantly within 5% of each other. The transmitter/transceiver meters are NOT accurate enough to make these measurements. Drake paid less than $1 for them, so they are 'indicators' at best. I always calibrate the meter shunt to read as accurately as possible atthe BIAS current, as that is the one current that is most important in the operation of the radio.

Similarly, allthree should be of the same brand, preferably Sylvania, Zenith, RCA or GE. Those four brands have all proven towork reliably. Drake shipped with all three at one time or another, (Zenith = Sylvania). Other brands 'may' work, but not consistently, some do, some don't. Keep in mind that these tubes were designed to operate at 15 kHz and we're using them up to 30 MHz. Sylvania was the only company to actually characterize these tubes and publish the data for RF use. Mechanical variations in assembly not important at 15 kHz may be VERY important at 30 MHz. There have been reports of tubes, even from the preferred manufacturers, that are too tall to fit in the PA. I'm not sure of the source(s) because the outliers are considerably out of the tolerance specified for 'seated height', which is unlikely due to the highly automated manufacturing processes involved. I don't know if they were 'rebranded' tubes, or what!?!

Hello Garey,

Thank you very much for the detailed explanation about the tubes!

How can I easily measure the bias current or equivalent voltage?
I read somewhere something about a test point that has a proportional voltage, but I didn't find that test point...

That test point was only on the AC-3 power supply. It was a wirewound resistor between the HV supply and chassis ground. It only read ~ 0.5V at idle, so wasn'tall that accurate with the VTVMs of the day. With today's DMMs, it would be useful!

Drake had a test panel with 'real' meters between the power supply and the radio. I have a good meter in a box with Jones connectors on each end that does the same thing. It's in series with the HV lead. This ignores the Screen current, but that's only a couple of mA and I just mentally allow for it. Again the 'relative current' is more critical than the 'absolute current' here, within reason.

Claude,

I was just telling Garey in an email last night that I was really glad that no one had become interested in the pair. As I dig deeper into the R-4, it has much more serious problems than had originally been seen. Shipping/moving is hard on the gear, and this one has been "repaired" after the moving damage. I'm not sure the repairer saw all that needed doing. It may well end up being a parts donor.

Besides, shipping to France I would think more than the worth of the rigs.

Yes, Don, I emailed you some days ago, just after your message that nobody was interested, but today your message came back as undeliverable. That's why my late reaction.
And yes, shipping has become very complicated. I am using a freight forwarder and I am doing batch jobs, this brings the cost a bit down.

But if the receiver isn't working well, it's no use because the one I've got now really pleases me a lot, even if it is not an absolute beauty.

Hi folks,
Garey knows this as well, if you have the rig open, you can easily measure the plate (incl. screen) current of each final by measuring the voltage across each cathode resistor. First measure the value of each resistor, and if they are more than 5% different replace them with matching ones. Use ohms law to calculate the currents.

Hi all,

Recently got my first Drake which is a SPR-4 from a second hand shop.

The audio board is burnt out and the 12V regulator board looks badly repaired.The regulator transistor looks like a replacement,hanging in the air.

I managed to get a copy of the circuit diagram and repairing the 12V supply board looks fairly straightforward.

But I can not work out the line going from the junction of Q19 Emitter/Q20 Collector and R82 to S14R and CR10.

Could someone please explain the working of this circuit.

Thanks,

[Non-text portions of this message have been removed]

Thanks Gary.
Finally got the XYL down there to help get the bias set correctly.

Now, I'd like to put the final cage back on before I have a problem. That's gonna be tuff because one of those screws goes where my fingers won't fit. Maybe another job for the XYL. But, before I put the cage back, I'd like to clean the dust and crud off the finals. XYL suggests we keep track of the numbers, etc., and write them back on with a marking pencil. What does anybody think?

Gary, you mentioned to check signal at v4 and v6. Wonder ifyou can describe how to find those tubes--with my eyes shut.

Thanks,
Howard

Howard -

First, the BIAS should be set for 0.1A, not 1.5A! The idle current
should be set to 0.1A.

Listening on a separate receiver, can you HEAR a signal on 40M when
you key the transmitter, even a very weak one.

Using your external receiver with a little sample loop for an antenna,
put the loop near V4 and see if you can hear a 7.000 MHz signal with
the PTO of the TR-4 set to 000. This would be in TUNE mode, -x on the
SIDEBAND switch. If you can, see if it's stronger at V6. Keep an eye
on the PLATE meter to make sure the plate current doesn't jump up
during this test.

Howard -

You really need a CD... :-) Pulling the finals is no big deal. Just becareful when you remove the top cap and swing them carefully out of the way. Inspect the solder connections to the RF Choke 'post' that they all connect to to make sure they don't crack when you finish and have the caps back on the tubes. All three tubes are the same, so it doesn't matter which order they are in. Remember the power is off and the Power Supply is disconnected.

There are four tubesin a rectangle just in front of the PA cage, along the side of the chassis. Looking down from the top, with the front panel 'to' you, V6 is the top right tube of the group, and V4 is the lower left tube. V4 is the Mixer and V6 is the Driver for the PA.

JT -

That lead is NOT connected where it crosses the Emitter lead of Q19.
That's why it doesn't make sense! :-)

Back in the olde days, wires crossing like that would have a "U" shape
to show the crossover, but that was too much trouble to draw, so they
started putting a big 'DOT' where it was a connection (like the one
just below the one in question). This was 'ok' for the original
drawing, but by the time it's photocopied a couple of (dozen) times
the crossover isn't all that clear.

Another method eliminates the use of the line loop and dot. Instead, where two connected lines need to cross on the schematic, the crossing line is staggered into a "T." That way, nothing special is required and the connection clearly shows up on photocopies.

13011. Re: No good output with my new (old) TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-06 20:22:45 UTC
From: John Sehring
Topic: 13011 Message: 13011

Easy way to determine "goodness" of tubes in Drake finals, both for T-4* and TR-* radios.

With tx keyed, at moderate plate current, measure voltage at top of cathode resistors of finals vs. chassis ground.

Can repeat with full rated CW plate current but make it quick--these are sweep tubes!

This voltage is proportional to plate current. Look for reasonable balance of voltages from each tube.

To get more accurate, measure resistance of each cathode resistor WITH NO power applied to transmitter. It's likely drifted some.

Then Ohm's law I = E/R will give you current.

I prefer to use a high quality (e.g. Fluke) DMM for this due to RF being present, can throw some DMM's way off.

Best method is to use ye olde fashion VOM like a Simpson 260--totally passive, quite RF proof.

Hi John -

Welcome!

One caveat for this method. The resistors really need to be measured, since many are up to 17 - 19 ohms. The absolute value isn't as critical as the relative values, since this determines the 'balance' of the PA tubes. Don't forget that you are measuring very low resistances, and don't forget the resistance of the test leads where appropriate. They can easily be anohm or two on their own.

My goalis to have the resistors within +/- 15 Ohms _AND_ +/- 5% of each other. Overkill perhaps, but not all that hard to accomplish and just one less source of distortion to worry about.

From: yash@aol.com
Topic: 13013 Message: 13013

Just finished going thru my t4x and have a rig that will tune up to about 70 watts max, on the meter. Its the same for 80 to 20 and a bit less on 10. I was told this when I bought the rig. I have a new pair of finals I will put in sunday. A quidk check shows all voltages and bias correct. Is there anything else that will cause lower output, besides final tubes,normally? Just curious. also have a new driver.
thanks

By "70 watts max, on the meter" do you mean the plate meter, or an external known watt meter? There have been 2 posts today about measuring true plate current, if you're relying on the T4-X's meter, maybe you should check it out.
You might also check the plate dropping resistor for the driver, as well as the cathode and screen resistors for the finals.

Dale -

Check R26, R24 & R23.

You sure both PA tubes are lit ?!?!?

~0.5 VDC across both 15 ohm resistors at idle??

13016. The Drake T-4 reciter from hell

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-07 21:12:45 UTC
From: qrper
Topic: 13016 Message: 13016

Well gang,

I've been working on this reciter for a while and not making much progress.

It just didn't seem to want to settle down and play nice with others.

The output would move and drop and hen go back up and drop. Sometimes there would be nothing out and then it' start amplifying its own carrier frequency.

I fixed it.

It seems to me that the problem may have been from the factory as I can't figure out how the fault happened. And the fault?

On the band switch, the second wafer from the front panel, on the 40 meter position the finger (tab) of the wafer didn't go through the fingers. It went under them. The fingers weren't broke, they weren't damaged, they just didn't make contact with the tab. Now, sometimes they would and most of the time they didn't.

The bandswitch main shaft didn't allow the wafer to move and it didn't just fall out. So, I had to remove the bandswitch shaft, wiggle the wafer into the fingers and reinstall everything.

100+ watts on every band now and it's on the right bands. No more 5.649 or 11.xxx freq.

Just wanted to let the group know.

Mike -

Well that's a new one!! :-) Good catch...

That's the BAND crystal selector wafer, so that'swhy the IF output IF
you tune the RF TUNE to 5.645 MHz, it means there's no PreMixer signal
reaching the 2nd Mixer, which means either the BAND OSC or PTO is
probably not running.

Nothing worse than a 'sometimes' problem!! Thanks for reporting back.

You're right! There is nothing more upsetting than having a problem that keeps changing.

It took a while to fine, good thing I pay myself by the hour.

It wasn't until I flipped the radio over at a different angle and with a bright LED flashlight did I see the tab completely missing the two fingers.

Grrrr....

Having been in both worlds, I know that there tends to be a different subset of problems that you look for in production troubleshooting than what you look for in repair of something that was (presumably) once working correctly. It takes a bit of re-training in your way of thinking when going from one paradigm to the other. Problems that don't belong are often the hardest to find.

From: Garey Barrell
Topic: 13022 Message: 13022

A 'discussion' has been going on over on that 'other' reflector (The "C" word) regarding the 'proper' procedure for replacing a component in one of our babies.

Several are touting the little Sprague coils (I forget the name, 'quigs?') that aretinned andfluxed. You cut the old component out, slip the 'coil' over the cutoff lead and poke the 'new' part lead intothe other end of the 'coil' andheat. Of course, most use a soldering ironbut I believe I recall back when they were being included in each package of caps from Sprague, that the instructions said it was as simple as heating it with a match or lighter!!. The idea is that you don't have to clean out a terminal strip and unwrap a wire to get the old one out. This led into solder removal techniques, Solda-Pults, braid and my favorite, the Hakko 808 solder sucker. The Hakko will clean solder out/off of anything smaller than abicycle frame, making it simple to merely unwrap the wire with a soldering aid tool. (Pointy end / bifurcated end.)

Drake had a 'better idea', just an eyelet filled with solder in a board, heat the eyelet, pull out the old lead and poke in a new one! :-)

Eventually it got into the 'Art wouldn't have approved' discussion (you DO know that each sealed PTO has air in it that was breathed by Art don't you)?

13024. PS-7 Trouble

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-08 02:19:56 UTC
From: Garey Barrell
Topic: 13024 Message: 13024

I was sitting at my desk yesterday afternoonwith the 7-Line on 40M CW with the gain turned down, just to have some background music. Suddenly, I noticed that there was a 'sizzling' sound for a few seconds, that oh so familiar odor, and the TR-7 went dead. I knew better, but I turned the TR-7 off and back on, but ... nothing.

My body is much less accommodatingthe last couple of years, and of course the power supply is on the floor between two cabinets, and the TR-7/R-7 is on a shelving arrangement on the desk with no back access. So I managed to clear the desk (no small feat initself) and slidthe TR-7 out and pulled the 4 pin connector. I was able, with difficulty, to get the PS-7 out far enough to pull thefuseholder, and sure enough ... smoked. So being the eternal optimist, I put in a new 8A fuse and switched the TR-7 back on with the strip switch. Hmmm, lights dimming slightly and humming from the supply so turned it back off.

I had been intending to put another TR-7 in that spot because the present one had way too much loss in the 500 ohm filter. My wife was able to find the other TR-7, still packed in it's box from Atlanta 5 years ago ("We'll only be here a year or so"), and put it on the desk. Got another PS-7 and put it in place, plugged in all the cables and turned it on. Seemed to work fine until I noticed that when I keyed the transmitter, the R-7 didn't mute. Strange... So pulled it back out, pulled the TR-7/R-7 cable at the TR-7 end and was able to mute and unmute the receiver with a clip lead on the plug blades with no problem. Very Strange. Put an ohmmeter on the ACCY connector on the TR-7, showed continuity. When I keyed the transmitter the connection showed open, but when I released it, it didn't come back to short. Not a whole lot tothat 'circuit', so I put in a new relay, and working fine! I hate those wire hold-downs on the relays!!!

Anyway, back in action. I suspect a shorted filter cap in the PS-7, and perhaps a blown PIN diode in the filter switching in the TR-7. So now all I got to do is get Carol to move these suckers to the bench so I can FIX them both.

Garey,

Has anyone done any research on the big capacitors in our PS-7 supplies as yet?? It may be time we ALL rebuild the one or two supplies that we use the most and prevent this happening to all of us!! We are good about recapping our 4 Line gear, and the TR7 isn't that much younger. What do you think??

I suspect that the PS-7 is so overbuilt that not many of them have failed yet.
And the life is extended when we add the optional fan.

I suspect that you are right, Jim, but I'm getting like Garey and less able to do all this as we age. I may want to do one or two just in case and have that cushion out a bit further. I plan to have a TR7 when they plant me!!!

Subject: [DrakeRadio] PS-7 Trouble

I was sitting at my desk yesterday afternoonwith the 7-Line on 40M CW with the gain turned down, just to have some background music. Suddenly, I noticed that there was a 'sizzling' sound for a few seconds, that oh so familiar odor, and the TR-7 went dead. I knew better, but I turned the TR-7 off and back on, but ... nothing.

My body is much less accommodatingthe last couple of years, and of course the power supply is on the floor between two cabinets, and the TR-7/R-7 is on a shelving arrangement on the desk with no back access. So I managed to clear the desk (no small feat initself) and slidthe TR-7 out and pulled the 4 pin connector. I was able, with difficulty, to get the PS-7 out far enough to pull thefuseholder, and sure enough ... smoked. So being the eternal optimist, I put in a new 8A fuse and switched the TR-7 back on with the strip switch. Hmmm, lights dimming slightly and humming from the supply so turned it back off.

I had been intending to put another TR-7 in that spot because the present one had way too much loss in the 500 ohm filter. My wife was able to find the other TR-7, still packed in it's box from Atlanta 5 years ago ("We'll only be here a year or so"), and put it on the desk. Got another PS-7 and put it in place, plugged in all the cables and turned it on. Seemed to work fine until I noticed that when I keyed the transmitter, the R-7 didn't mute. Strange... So pulled it back out, pulled the TR-7/R-7 cable at the TR-7 end and was able to mute and unmute the receiver with a clip lead on the plug blades with no problem. Very Strange. Put an ohmmeter on the ACCY connector on the TR-7, showed continuity. When I keyed the transmitter the connection showed open, but when I released it, it didn't come back to short. Not a whole lot tothat 'circuit', so I put in a new relay, and working fine! I hate those wire hold-downs on the relays!!!

Anyway, back in action. I suspect a shorted filter cap in the PS-7, and perhaps a blown PIN diode in the filter switching in the TR-7. So

now all I got to do is get Carol to move these suckers to the bench so
I can FIX them both.

13032. Re: [DrakeRadio] Component Replacement

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-08 14:24:39 UTC
From: Wes Bolin
Topic: 13022 Message: 13032

I had some questions about component replacement, so I asked the question on a couple of groups/lists. Got various answers: Some liked the
'coils' and some said de-solder,strip the lead, and re-solder. I chose the 'coils'. Main reason is that I figured I would do more harm trying to desolder lugs, terminals, pins, etc than just using 'coils'. My project receiver was a
Hammarlund SP600 with over 60 capacitors needing replacement. Also, I learned that if I needed to remove a coil-lead component, it was very
easy to do and then add one back on the stub of lead. Plus, the 'coil' gave some mechanical stability along with electrical connection. But it was
most helpful when replacing capacitors buried under layers of components or stuck in inaccessible places.
I did de-solder some leads that had to be lifted so sub-assemblies could be removed. The manual actuated solder sucker pump worked very well.
I recommend it.Tried the manual pump built into a solder iron and didn't like it.
The 'coil' method works. My receiver played flawlessly after more than 60 Black Beauties of Death and a dozen more other capacitors were
replaced using this method. I also used 'coils' when re-capping my Drake 2B. Easy job, and it works great too.
This is my experience, for what its worth.
Wes

Subject: [DrakeRadio] Component Replacement

A 'discussion' has been going on over on that 'other' reflector (The "C" word) regarding the 'proper' procedure for replacing a component in one of our babies.

Several are touting the little Sprague coils (I forget the name, 'quigs?') that aretinned andfluxed. You cut the old component out, slip the 'coil' over the cutoff lead and poke the 'new' part lead intothe other end of the 'coil' andheat. Of course, most use a soldering ironbut I believe I recall back when they were being included in each package of caps from Sprague, that the instructions said it was as simple as heating it with a match or lighter!!. The idea is that you don't have to clean out a terminal strip and unwrap a wire to get the old one out. This led into solder removal techniques, Solda-Pults, braid and my favorite, the Hakko 808 solder sucker. The Hakko will clean solder out/off of anything smaller than abicycle frame, making it simple to merely unwrap the wire with a soldering aid tool. (Pointy end / bifurcated end.)

Drake had a 'better idea', just an eyelet filled with solder in a
board, heat the eyelet, pull out the old lead and poke in a new one! :-)

Eventually it got into the 'Art wouldn't have approved' discussion
(you DO know that each sealed PTO has air in it that was breathed by
Art don't you)?

Jim, you are right the PS-7 is a rugged piece of equipment. I had my PS-7 fail some time ago and blow the fuse, as designed. I turn on the system using a power strip and don't use the power switch on the TR-7. This is the first problem I have encountered with the PS-7 since purchasing it new in 1979.

After some trouble shooting one of the pass transistors was found shorted and caused the output voltage to rise to 26.2 volts. The voltage control system activated the SCR which shorted the output to ground and blew the fuse. Upon removing the pass transistors two of the transistors on one side had two insulating wafers under them and the one's on the other side did not have any wafers. This is how it was shipped from the Drake factory. The four pass transistors were replaced with higher value ones and the insulators are now under each one. The C228F3 SCR was replaced with a NTE5562 SCR as it showed very low resistance. The voltage is now correct at 13.6 volts.

I should replace the two 15K uf electrolytic capacitors in the PS but have not found replacements that would physically fit and reasonably priced. If anyone knows of a good source for these capacitors please let me know.

Gary, I read the digest from this group daily and appreciate the depth of knowledge here and the generosity of the group in helping with problems with the Drake radios. My first decent radio as a new ham was a TR-4 which I used for several years.

I am in need of a four position remote controlled antenna switch so i can use the dipoles on my tower. The one I was using, an old military type, failed after about 25 years.

Wes, I had not thought about “quigs” for years. I recall them myself, they worked well. Found a couple of comments
in other forums that touched upon this very subject. Only issue would be, the reaction by boat anchor enthusiasts
and “purism.” Hmmm, maybe too, the reaction by those who have repair services available, like Garey for instance.

Here are those comments regarding “quigs”:

I believe they were called "quigs" and were made by Sprague.I would imagine that you could find some at an old tv repair shop if you can still find an old tv repair shop.You could probably make your own out of 20ga buss wire.Just use a nail as a former.

We have some of those springs, am not sure where they came from but I haven't used them...I just make a hook in the cut lead from where the old component was, filing it if necessary to remove oxidation, then make a hook in the new component lead, clamp both together firmly with needlenose and solder.

I just make a spiral quig from the extra length of wire on the new component. I just hold the lead against a miniature screwdriver and wrap it around 4 or 5 turns and cut the excess. I slip that over the stub of the old wire still soldered in place. Then I squeeze it on to the stub with a pliers for solid contact before soldering. Not the perfect cosmetic repair, but very good for matching original wire lengths and not disturbing settings.

While I am not selling, and typically am not a fan of MFJ/Ameritron, I have an Ameritron RCS-4, that works quite well. No control wire, between the shack and the tower. Everything operates through the coax.
Just thought I'd mention this, in case you might wish to consider an Ameritron.

Howard -

I'm not totally against them. Their original intended use, if I remember correctly, (far from a 'done-deal',) was for repairs where you didn't have access to a soldering gun or other tools. I'malmost certain that the instructions said that if a soldering gun was not available, you could heat with a match or cigarette lighter, and both were far more available than a soldering gun in the 50's.

Today, we still find components in our boatanchors that are most inconveniently located and/or the builder followed the Heathkit directive to 'wrap the lead around the post to form a solid mechanical connection before soldering'. There is certainly nothing wrong with using a quig electrically or mechanically. Properly applied, they are every bit as solid as desoldering, unwrapping, rewrapping and resoldering. I freely admit to simply poking a hole in a terminal strip tag with a soldering aid, big enough to stick a 'new' component lead through, and soldering. I don't think I have ever 'wrapped' a lead around or through a terminal before soldering, but then I don't fly or drive my gear. To the best of my knowledge, none of the solder connections I have made over the last 60 years have failed due to mechanical stressor vibration.

At the other end of the spectrum, I have seen repairs allegedly done by 'professionals', where two wires were just 'touched' and soldered, then left hanging! Come to think of it, I've never found one of those 'broken' either!! Solder is strong stuff.

The Hakko desoldering 'gun', a soldering gun with a hole through the tip and to a filter and on to a built-in vacuum pump. Merely touching it to a soldered terminal or electrolytic soldered to a chassis, then pulling the trigger to start the pump, and the solder just disappears. Yeah, it's almost $200, but how many PC runs, wire insulation, other components, etc., have you destroyed, and what is your time worth?

Bottom line, I prefer making a new connection at the terminal, even if it is just a hole poked through a terminal tag, to a 'mid-air splice' using a quig. Certainly no better, or worse, from a 'functional' standpoint.

I'malmost certain that the instructions said that if a soldering gun was not available, you could heat with a match or cigarette lighter, and both were far more available than a soldering gun in the 50's.

Today, we still find components in our boatanchors that are most inconveniently located and/or the builder followed the Heathkit directive to 'wrap the lead around the post to form a solid mechanical connection before soldering'. There is certainly nothing wrong with using a quig electrically or mechanically. Properly applied, they are every bit as solid as desoldering, unwrapping, rewrapping and resoldering. I freely admit to simply poking a hole in a terminal strip tag with a soldering aid, big enough to stick a 'new' component lead through, and soldering. I don't think I have ever 'wrapped' a lead around or through a terminal before soldering, but then I don't fly or drive my gear. To the best of my knowledge, none of the solder connections I have made over the last 60 years have failed due to mechanical stressor vibration.

At the other end of the spectrum, I have seen repairs allegedly done by 'professionals', where two wires were just 'touched' and soldered, then left hanging! Come to think of it, I've never found one of those 'broken' either!! Solder is strong stuff.

The Hakko desoldering 'gun', a soldering gun with a hole through the tip and to a filter and on to a built-in vacuum pump. Merely touching

it to a soldered terminal or electrolytic soldered to a chassis, then pulling the trigger to start the pump, and the solder just disappears. Yeah, it's almost $200, but how many PC runs, wire insulation, other components, etc., have you destroyed, and what is your time worth?

Bottom line, I prefer making a new connection at the terminal, even if it is just a hole poked through a terminal tag, to a 'mid-air splice' using a quig. Certainly no better, or worse, from a 'functional' standpoint.

From: Bob Macklin
Topic: 13022 Message: 13041

I simply clip the leads off the old component next to the component and then bend the remaining wire into a hook. I then clip and bend the leads of the new component to fit between the hooks and solder.

If the leads on the original component are to short I just remove the whole thing.

I find a soldering gun too big for most changes other than chassis mount capacitors.

KW Electronics in the UK (50s & 60s) used them as standard construction method.

All the Rs & Cs that were connected to a valve (tube) base were left with their bodies pointing down.
Component legs that were to be connected together were all put into a "squig" (never heard the name before) & soldered.
If there was a wire to lead off elsewhere it also went into the squig, from the other direction.

It certainly makes repairs fairly easy. It's quite a tidy way to build stuff, too, so long as you have enough room.

Wes, I had not thought about “quigs” for years. I recall them myself, they worked well. Found a couple of comments
in other forums that touched upon this very subject. Only issue would be, the reaction by boat anchor enthusiasts
and “purism.” Hmmm, maybe too, the reaction by those who have repair services available, like Garey for instance.

Here are those comments regarding “quigs”:

I believe they were called "quigs" and were made by Sprague.I would imagine that you could find some at an old tv repair shop if you can still find an old tv repair shop.You could probably make your own out of 20ga buss wire.Just use a nail as a former.

We have some of those springs, am not sure where they came from but I haven't used them...I just make a hook in the cut lead from where the old component was, filing it if necessary to remove oxidation, then make a hook in the new component lead, clamp both together firmly with needlenose and solder.

I just make a spiral quig from the extra length of wire on the new component. I just hold the lead against a miniature screwdriver and wrap it around 4 or 5 turns and cut the excess. I slip that over the stub of the old wire still soldered in place. Then I squeeze it on to the stub with a pliers for solid contact before soldering. Not the perfect cosmetic repair, but very good for matching original wire lengths and not disturbing settings.

Subject: Re: [DrakeRadio] Component Replacement

I had some questions about component replacement, so I asked the question on a couple of groups/lists. Got various answers: Some liked the
'coils' and some said de-solder,strip the lead, and re-solder. I chose the 'coils'.
Main reason is that I figured I would do more harm trying to desolder lugs, terminals, pins, etc than just using 'coils'. My project receiver was a
Hammarlund SP600 with over 60 capacitors needing replacement. Also, I learned that if I needed to remove a coil-lead component, it was very
easy to do and then add one back on the stub of lead. Plus, the 'coil' gave some mechanical stability along with electrical connection. But it was
most helpful when replacing capacitors buried under layers of components or stuck in inaccessible places.
I did de-solder some leads that had to be lifted so sub-assemblies could be removed. The manual actuated solder sucker pump worked very well.
I recommend it.Tried the manual pump built into a solder iron and didn't like it.
The 'coil' method works. My receiver played flawlessly after more than 60 Black Beauties of Death and a dozen more other capacitors were
replaced using this method. I also used 'coils' when re-capping my Drake 2B. Easy job, and it works great too.
This is my experience, for what its worth.

A 'discussion' has been going on over on that 'other' reflector (The "C" word) regarding the 'proper' procedure for replacing a component in one of our babies.

Several are touting the little Sprague coils (I forget the name, 'quigs?') that aretinned andfluxed. You cut the old component out, slip the 'coil' over the cutoff lead and poke the 'new' part lead intothe other end of the 'coil' andheat. Of course, most use a soldering ironbut I believe I recall back when they were being included in each package of caps from Sprague, that the instructions said it was as simple as heating it with a match or lighter!!. The idea is that you don't have to clean out a terminal strip and unwrap a wire to get the old one out. This led into solder removal techniques, Solda-Pults, braid and my favorite, the Hakko 808 solder sucker. The Hakko will clean solder out/off of anything smaller than abicycle frame, making it simple to merely unwrap the wire with a soldering aid tool. (Pointy end / bifurcated end.)

Drake had a 'better idea', just an eyelet filled with solder in a
board, heat the eyelet, pull out the old lead and poke in a new one! :-)

Eventually it got into the 'Art wouldn't have approved' discussion
(you DO know that each sealed PTO has air in it that was breathed by
Art don't you)?

Component replacement can be problematical and finding the least invasive method of replacement is best. I work a lot with the domestic valve radios and always use "coils". I got the idea from Tesla Radios, they were made that way as were some Philips models. A real bonus is you can make your own from solid core hook up wire or indeed surplus component leads. I have recently bought from a local hamfest here in the UK, 2 boxes of 100 resistors each suitable for valve equipment for ?1.00 . You can make the coils to take 2 or 3 leads and of course they are easily removable- just heat up slide off and discard. A real bonus too is if you are unsure whether a component is faulty, just snip one lead, hook up the new component, test, and if found not to be faulty, just pop the connections into a "coil" and solder.

Works every time and prevents desoldering and unravelling multi terminal connections. Looks neat and with practice looks really neat. I wind mine over a very small drill made for component lead hole drilling in PCB's

Bernie,
Based on this thread, and the one previously, on "the other reflector", I will check with my buddies, Pat, W6PMD, who owns a TV repair shop, and John, KJ6PCY, who repairs TV's, and see if they might have a line on them, and I'll get back to y'all on the subject.

Bernie -

Most guys are making their own. One guy made a tool, just a shank slightly larger than a component lead, and cut a slot in the end. Put a piece of tinned wire inthe slot, wind 6-8 turns around the shank, and cut it off. Cut off the bent end and you have a 'quig'. I'm not sure at all of that name, I keep thinking squib, but I know that's not right!!

The real ones had solder and flux on them, but if the wire is tinned and a bit of liquid flux is applied, they would probably work well enough to 'stick', and then you could flow a littlesolder on them.

They came with new boxes of Sprague capacitors, back when five capacitors came in a plastic box. I just checked my 1958 and 1967 Allied catalogs and no luck. I don't know that you could buy them separately, I assume that you could, but every shop I've worked in had a drawer full of them, ones that hadcome with caps and were unused. There were always plenty in the drawer!...

From: Dan Galligan
Topic: 13022 Message: 13048

I just got off the phone, from talking with Pat. He remembers them as an electronic version of a condiment, that came with resistors, capacitors and such, in a cellophane pack. He even described the cellophane, as being the type to turn orange, with age.

Pat said that they were like automatically getting catsup, salt, or pepper, with fast food. It was pretty much automatic. He said that he couldn't begin to imagine, how many he likely just tossed away, over the years. They, like most everything else, went away, like replacing individual components. It is so rare in the TV industry, today, to replace an individual part, just like everywhere else in the electronics industry.

But, between he, and his repairmen, they can't remember the name of them as being, or not being, "Quigs". It's just been too long since they used them, that he just can't recall the name. He's been in the business, more than 40 years, and one of his repairmen, substantially longer than he.

Jim -

Yeah, this one had the fan on it, and really not heavy use as I
normally run my B-Line.

I'm at a disadvantage because it's sitting on a chair, (bench is
full,) but it appears that at least two of the pass transistors are
shorted.

Couple of questions you or someone else may be able to answer.

1. Do the pass transistor covers just pry off?

2. Someone mentioned 'better' transistors?

3 Does the SCR typically fail when tripped?

Any other tips, hints??

From: wb4spb
Topic: 13022 Message: 13051

For a couple of years, I've been essentially winding my own "quigs" (if that's what we're calling them) onto replacement component leads using the technique described in this video: http://www.youtube.com/watch?v=OI9P01eYbjA

It's pretty obvious stuff, but the video did me the favor of telling me what tool to use.

As there are no loose pieces to fool with, I find I can get components fitted in rather tight spots using needle-nose pliers, tweezers, and the like. And I like the way they look.

Hello

I too belong to that other list and considered a heretic, washing my Collins rigs (oops)

with Simple green, a water hose and oven dried.

Anyhoot, I've been using the 'quigs' method to do all of them.

Here is my version of a tool made from hobby brass tubing, less than $5.

<http://youtu.be/GRjHuiBfYTc>

And if you care, here is me washing the KWM-2A. They all talk about it

but none have shown it done.

<http://youtu.be/j1fSRVwbSTo>

NOTE: Thinking of being a smart one, I tried the same on an old Underwood

typewriter. It was rusted the next day. Sold it for the typewriter keys.

So.. I wouldn't try this on a steel base rig, like a Halli or such.

Back to my hole.

To All,

Please see the article in the following link where the coiled wire device
is called a quig. Instructions for making a quig winder are included.
http://www.skywaves.ar88.net/commrx/Maintenance/Comprepl/component_replacement.htm

I often just wind a "quig" on the end of the replacement component rather
than install a separate coil on the joint. The advantage is that it is a
one step process and I can hold the component in the desired position while
soldering the joint.

Fernando,
I remember, several years ago, when I was looking for service on my "B" Line, reading, likely on QTH, eHam, or QRZ, about a fellow, who cleaned his Drakes in the dishwasher!!! He swore that he never had any negative results.
I guess that if it gets properly dried out, this wouldn't be problematic. I wouldn't try it, though.

I've used them all. Solda-Pullit is my daily driver at home. At work, I'm a big fan of both the Hakko and Pace vacuum irons that I have used over the years. They do require diligent maintenance, but the results are well worth it. No-lead solder seems to be especially hard on them, but I only have to deal with that crap at work. There is also a bit of a knack to using them. I don't know how many people I have heard over the years try them without proper instruction, only to declare them "junk" and move on.

I've pulled several decent ESD black Solda-Pullits out of the trash because the people that use them don't seem to realize that they need to be cleaned out once in a while. Go figure.

Thanks, Garey.

Got the finals cleaned up and back in place--and believe it or not, I didn't destroy the lettering on the tubes.

Checked for carrier at the two tubes you said and there is nothing. I thought it was just the receiver that didn't work but it looks like both transmitter and receiver.

Is there a next step--other than box it up to send away, hi hi?

Getting the cage back on was tuff. The XYL put the screws in for me. My fingers just wouldn't go in where one of those screws had to go.

73 and thanks.

Howard -

You really need a CD... :-) Pulling the finals is no big deal. Just becareful when you remove the top cap and swing them carefully out of the way. Inspect the solder connections to the RF Choke 'post' that they all connect to to make sure they don't crack when you finish and have the caps back on the tubes. All three tubes are the same, so it doesn't matter which order they are in. Remember the power is off and the Power Supply is disconnected.

There are four tubesin a rectangle just in front of the PA cage, along the side of the chassis. Looking down from the top, with the front panel 'to' you, V6 is the top right tube of the group, and V4 is the lower left tube. V4 is the Mixer and V6 is the Driver for the PA.

because one of those screws goes where my fingers won't fit. Maybe another job for the XYL. But, before I put the cage back, I'd like to clean the dust and crud off the finals. XYL suggests we keep track of the numbers, etc., and write them back on with a marking pencil. What does anybody think?

13060. TR-4C

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-09 05:32:18 UTC
From: va3ag
Topic: 787 Message: 13060

Hi folks!

I recently bought a Drake TR-4C transceiver. The previous owner did not have a S230 Mic connector so he replaced it with a 1/4 inch stereo plug.
I need some help as follows:

1) I would like to get help on how to connect a Shure 450 to my TR-4C
1/4" stereo plug.

2) My TR-4C needs a bath (Good cleaning) ideas/suggestions etc.

Any help would be greatly appreciated.

The original plug is wired with the push to talk switch
going to the tip, the hot side of the microphone to the ring
and the ground for both going to the sleeve. If you do not
use PTT the tip does not have to be connected. Check the
wiring to the stereo plug to see if its wired the same way.
Or, push an unwired plug into the jack and short the tip and
sleeve momentarily. If its wired as the original was it
should key the transmitter.
The safest material to use for cleaning is liquid
dishwashing soap and warm water. Getting corrosion off the
copper plated chassis is difficult and will take some of the
copper off. IMO its better to just clean the dirt off. You
will get different advice from everyone on this, there are
lots of ways of cleaning. IMO the less you can get away
with the better; more stuff is broken by cleaning than any
other way.

Thanks for the advise Richard, I will try what you suggested about the mic connections and the cleaning. I have never cleaned a radio before and I do not like using water to clean electronic equipment but everyone seems to suggest what you are suggesting so I will give it a try. I need to get rid of the cigarette smoke smell. Again Thanks for the advise Richard.

Here is a link to the type wire I have found nice to work with for the little splicing coils and radio work in general.
This wire is commonly found in the jewelry making crafts stores on ebay
Gauges from 14 to 26 readily available and possibly beyond that
I particularly like the workability of this wire plus fact that one can obtain small quantity at reasonable cost.

I have no affiliation with this seller and not recommending one way or other. There are MANY similar stores. This just popped up on a search. Almost without exception the wire sold by most of the stores is made by ARCOR, a US company.

Howard -

OK. Check the slide switch on the left side near the back. It MUST
be in the 'forward' position, pulled toward the front.

Remember you have to set the PTO to 7.000 MHz, and then key the
transmitter. ON a separate receiver, you should be able to hear 9.000
MHz, 16 MHz, and 7.000 MHz around V4, and only 7.000 MHz around V6.

These little coils caught my interest when I first heard about them so I did quite a bit of research. I made a Q&D mandrel using miniature tubing (to hold the end of the wire) acquired at a model hobby shop and a stiff coil former (miniature drill bit) sized to wind a coil that would accommodate two 1/2 watt resistor leads. Both are inserted in a small vice vertically. Wire is inserted into end of tubing and wound tightly around the drill bit to an appropriate length. Works pretty well and doesn't take too long to turn out a dozen.

I gathered a number of nuggets of wisdom off the web on the subject component replacement including pictures of several alternative ways of forming Quigs, a presentation Al Klase put together about restoration techniques that includes a section on Quigs, etc. If anyone is interested in reading /seeing this stuff, drop me an email direct. Later tonight I will (again) attempt to put these items in a file on this site.

Hi Gary
I just went through the repair of my PS-7 recently and it is now working fine.
The hour meter I have connected since new shows nearly 7000 hours of operation before the failure.
My PS-7 had one shorted pass transistor and the SCR showed low resistance so all were replaced.
The schematic shows 2N5301 transistors and we put 2N5886 as replacements.
The voltage and current parameters are much higher in the 2N5886 so they should last a lot longer and they were readily available.
The SCR did not fail on tripping but was marginal for continued usage.

BTW there are two schematics out there for the supply.
Drake move a few parts from and to the control board.
The serial number of mine is 3670.
If I remember correctly Drake made quite a few changes in the radio at serial 4000 so the PS may have also changed at that number.

Getting rid of cigarette smoke is one of the things
everyone seems to have a different opinion about. Some
cleaners, like household ammonia, will get it off but may
damage parts unless very thorougly rinsed off.
Most electronic equipment can be washed provided parts
like meters are removed first. After washing the unit
should be baked out in a dry oven at about 130F for at least
48 hours. The method we used at Hewlett-Packard long ago
was to wash out instruments using a paint spray gun loaded
with water and dishwashing detergent. Then it was rinsed
with a hose and then blown out with compressed air and baked
dry. Not sure you need anything as extreme for the Drake.
You must be careful of washing anything with paper parts
because the water may damage or even dissolve the paper.

13071. Drake AC4R back in stock

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-09 17:39:40 UTC
From: qrper
Topic: 13071 Message: 13071

boys and girls,

I have yet to update my website but I'm selling the AC4R kits again.

Price will remain the same for a while, shipping went up two bucks.

$65 +$8 shipping

contact me off list if you'd like one

mike wb8vge

13072. My non-working TR-4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-09 17:48:50 UTC
From: Howard Traxler
Topic: 12538 Message: 13072

Garey,

Further results from testing:
3975 KHz, Mode CW, USB/LSB set either way, Preselecter near 2:00 position, Drive 0, PTT closed, keyjack closed, into a dummy load

R-4C across the room with no antenna receives a solid carrier. weaker carrier when xmtr switched to CAL or SSB. Increasing the drive makes the carrier stronger. Plate tune and load effects the carrier strength. I get the normal 60Hz hum when touching the mic connection. Not enough output to register on my relative power out squawker (I use for tuning).

TR-4 still doesn't receive when connected to antenna.

There is a slide switch on the rear of the TR-4. Would that have anything to do with my problems.

Thanks, Garey

73
Howard, WA9RYF

Howard -

I have several of these 'projects' going. Need to refresh a couple of things.

Are you able to set the PA idle current to 0.1A?

Under test conditions:

7.000 MHz
Mode SSB
LSB
RF TUNE around 12 o'clock +/- 2 (adjust for peak)
GAIN 0
PTT closed
KEY either unplugged or closed
PLATE and LOAD adjust for peak.

Plate current should show 0.1A (idle current)

Increase GAIN while 'watching' PLATE current. Signal strength should increase with GAIN, and PLATE current should be 'dipped' with PLATE control.

IF PLATE current does NOT increase whenGAIN is increased we have a problem. If PLATE current increases but output does NOT, then check your power meter!

The slide switch on the rear panel only dims the panel lamps for night-time / mobile use.

Ok Richard thanks again for the advise, the more I think about it the more I think I should
```

have someone who is done this before to do it for me. I will decide what I am going to do shortly.
The radio is in working order 175 watts on 40 Meters but it needs some cleaning and painting of the top and bottom of the radio.

I like equipment that looks clean but found that too much cleaning often does damage. For much equipment one can use canned air to blow out loose dirt and alcohol in spray cans along with a variety of small brushes to clean out the chassis without disassembling. Some stuff just won't come off. I restored an RCA AR-88 (look it up if you are not familiar with it, they are not too common). This receiver was made with oil-filled bathtub paper caps. After many years the seals disintegrate and the oil and wax leak out. When I got mine the bottom of the bottom cover, which is a sort of shallow tray, was filled with oil. I washed it out with soap and water and some Kerosene but could not get the wax off except by scraping. The wax evidently had somehow also gotten on the top of the chassis. It was covered with waxy grime that was extremely difficult to remove. I could not find a solvent that would cut it and some began to remove the printing on the chassis. I just cleaned as best I could and left it alone. I tried in small amounts naphtha, disc brake cleaner, acetone, xylol, mineral spirits (AKA Stodard solvent), isopropyl alcohol, denatured alcohol (which is mostly ethyl alcohol), MEK all to no avail. Managed not to damage it. I replaced all the paper caps and it works like a charm. The receiver was designed so that it does not have any electrolytic caps in it. Despite being about seventy years old it hears everything my Drake R4XB does.
Keep me posted on your progress but I think perhaps you should just leave well enough alone.

From: VE3AX/7
Topic: 787 Message: 13076

Aldo:

Don’t be too afraid of dousing your TR-4C with water. I’ve done three – an R-4, a T-4X and a TR-4C – and all turned out just fine. Believe me, it was not my 1st choice, but the smoke residue on these three rigs was so bad I really did not have a choice. Ordinarily, I do the judicious clean up with cotton swabs, small brushes, a bit of 99%+ isopropyl alchohol, lots of soft cloths, and maybe a bit of Windex. But sometimes you just have to break out the hose!

What I did was this – remove the knobs, front panel, dial plastic, meter, the PA cage (or at least the top of it), the T/R relay, and the PTO (3 wires to unsolder – mark connections). Pull all the tubes but mark which ones go where. On the TR-4C you don’t need to worry about a transformer but you would have to plug the wire hole with putty on an R-4x xformer. I have used both regular Fantastic (not the kind with bleach!) and Simple Green – both work fine. I did not lose any chassis lettering except when I tried a steam cleaner – that thing I took back to the store. Some of the gurus on the Hallicrafters group have recommended “Scrubbing Bubbles” which I have yet to try but I have some here which I may try soon on an SR-400. Just rinse well with light water pressure from the hose. Apply twice if necessary.

I did not use the oven on the TR-4C to dry it out but did on the R-4/T4X – set at 150 deg F for several hours. On the TR-4C I used direct sunlight outdoors on a windy, dry day. Both drying methods worked fine. I also left the rigs for 2 or 3 days before re-assembly. Do the usual cleaning of switches and relay with a bit of De-Oxit, and pots with a bit of Faderlube. You may want to check the lube on the variable cap shafts in the PA to make sure they are still OK.

You will probably need to disassemble the dial/gear mechanism to clean properly – not for the faint of heart! Tough doing the 1st one. Take pictures or draw it out as you disassemble. Lay it all out on a large white cloth. Be very careful not to lose the little brass rivets. I try to get as much of the old red grease out of the ball bearing assembly in the front of the PTO with long “Q-tips” and isopropyl. Then re-grease the bearings with a small amount of white lithium. I clean the threaded rod with iso as well the same way and place a drop or two of very light machine oil (check your wife’s sewing machine!) on there and run it back and forth a few times. Do NOT lube the plastic gears!!!!! Clean them all and I usually run a bit of rolled up very fine sandpaper through the centre shaft holes just to make sure they are smooth. Check the brass shaft for burrs as well – smooth with a bit of 600 grit or higher emery paper as needed. Re-assemble – you DID take pics didn’t you! Windex works fine on the dials and doesn’t remove the lettering. Getting the dials aligned again is tricky the 1st time – think it may be described on Ron’s web page – www.wb4hfn.com. You will need a signal source.

Front panel will clean up fine with Fantastic – make sure you rinse with water afterwards. Watch the screwdriver doesn’t slip when putting the corner screws back in. Knobs will need a clean and polish – Brasso works for the latter but I am sure others have alternates. I use acrylic white paint available at artist’s supply stores to re-white the lines on the

knobs. Takes some practice but works well for me.

Good luck – takes some effort but nice rig when it's all done.

Ok Richard thanks again for the advise, the more I think about it the more I think I should have someone who is done this before to do it for me. I will decide what I am going to do shortly.
The radio is in working order 175 watts on 40 Meters but it needs some cleaning and painting of the top and bottom of the radio.

Aldo:

If you take the front panel off beware that there are fiber washer spacers between the panel and chassis at each screw. Take it apart in a shallow box or tray so that these small parts don't get lost. While the Drake stuff is not built quite the same way as old Hewlett-Packard instruments were but its not that different and I washed a couple of hundred instruments there. Rinse off using a hose and warm water, wash using a paint spray gun loaded with warm, diluted dishwashing detergent, rinse again using the hose and warm water, blow out with compressed air to remove as much moisture as possible, bake out in an oven at about 130F. This is high enough to evaporate the moisture but not hot enough to damage most components. Anything not waterproof must be removed, mostly meters and anything made of paper.

From: ka8asn
Topic: 13078 Message: 13078

I had to replace my regulator pot on my power supply board on my TR7 because it was real bad. Found it by accident. But it was interesting! Now the problem I seem to have is after getting the DC 10 volts set at 10.00 VDC on the parent board and replacing the 8.05 crystal on the PBT board, I have found either I have a bad frequency counter, BTW its a Fluke7261A, works fairly well with all my other stuff, I have found that the adjustment for C1030 does absoulty nothing. I set the 40 Mhz oscilator, and the to 40 mhz exatly,and that appears to work ok but when I go to set the 5.645 oscilator the close as i can get is 5.640 MHZ Do I need to change the capacitor also and what value should I use.And when I set the pots on the power supply board according to the service manual,the receiver sounds bad and the transmitter is off frequency and the last digit on my numerical display blinks and if I leave the receiver alone it will drift off about one to 3kc normally. The drift problem might be the pin diodes but have not got that far yet. I did the intinal adjustment using WWV and the receiver appears to work better> Transmitt have not yet had a chance to check.So either I have a bad frequency counter? Or jinks, or murphy has me, I am confused and would like some help? What is the best way to set the 40 Mhz Oscillator, The 13.695 and 8.05 crystal frequency and hopefully come up with the 63.950 output frequency. And then set the frequency Pots on the Power supply board? I may have some other things happening I am not aware of so any pointers would be appreciated.

From: Jim Shorney
Topic: 13078 Message: 13079

Mike,

It does take a fairly sensitive counter to align the TR-7. I've found that the 40 MHz will shift *slightly* due to cable capacitance, but not enough to be of concern to most people. Still, I prefer to decouple the cable with a small value carbon resistor (220 to 470 Ohms, the highest value I can use that provides a stable reading on the counter) at the probe tip to minimize this. Otherwise, align it exactly as the service manual says and it will be correct.

If you can get the 40, 8.05, and 13.695 (steps 3-3 through 3-5) adjusted correctly, the passband pots on the PS board should fall right into place. All they do is vary the 13.695 with relation to the others. You must do all three steps in the proper sequence! And the Passband Tuning must be set to ON and the front panel control set to center for adjustment of the 13.695 and 8.05, but OFF for the fixed passband pots. This is critical! If C1030 is not working, look for solder bridges or open connections. This type of capacitor rarely fails.

Bad PIN diodes will not cause drift. They are in the antenna circiuts. If you have another sensitive receiver that can monitor the 40. 13.695, 8.05, and the PTO, that will tell you where your drift is coming from. FWIW, I've never seen bad PIN doides, but lots of people seem to want to blame every ill on them. :)

While you were working on the power supply board, did you replace the large electrolytic capacitor? If not, do so before you do anything else. It is likely not related to your problem, but I consider it an "always replace" part. These caps are getting old and are starting to fail, and this one is particularly critical to proper operation of the rig. Strange things can happen when it starts to fail.

Again, the best way to align the oscillators is to follow the steps in the service manual, exactly and in order, without skipping anything. You don't need to go past 3.6 if the rest of the rig seems to be operating properly. I've never had to touch the VCO or translator. Everything following should be OK unless the rig has been "fiddled" with. The CW oscillator may need some extra love if you are a CW op, but that's covered in an article on the WB4HFN web site.

Talk about frustration..........

I'm trying to order a few parts to repair my PS-7 power supply.

2N5302 (4)

C288F3/NTE5562 (1)

8A ABC (5)

Shouldn't be too difficult, right? All are readily available.

The problem is, NO supplier has all three, requiring two or three separate orders, with of course a $6-12 shipping charge! Shipping is more than the cost of the parts.

Also, when did 1/4 x 1-1/4 fuses start costing over $1 EACH. Last time I bought them, they were less than $1 for a box of 5!!

I knew this Ryder truck full of parts I've been moving around with me was worth it. Of course none of the 10,000 parts (at least) that I have are any of the above!

Rats!

Thank you Jim, for you help. I going to try it again today and see what happens. I don't know if radio shack have those capacitors but will check. It's so hard to find any electronic parts in this town due to the fact that General Motors pulled out of Flint years ago. Just to replace my soldering gun tip I had to order it and it took 5 days to get here at very inflated cost. So I will let you know what happens.

Thank You

Michael J Trussell

Gary -

Yes, I've dealt with AMS in the past. They had the 2N5302, but they were $12 each v. $3.76 from Mouser and Digi. I couldn't find the SCR either, under the original C288F3 or NTE5562.

Another list member suggested eBay for the fuses, and sure enough, got 10 fuses with free shipping for $5.xx something. The glass body 3AG type in 8A is only rated for 32V, the ceramic ABC type is rated for 250V.

So I looked for the NTE 5562 and up came the ECG 5562 which is the same as the NTE 5562 for $11, which is about half the 'normal' price, again free shipping. Has a photo of it with hardware in package, so worth a chance.

So all I have to do is order the 2N5302s from Mouser or Digi, same price. The ones on eBay are either from China or more expensive than the ones from Mouser. I don't trust China for semiconductors, too many counterfeitsfloating around.

I got the Hakko out and am in the process of removing the 2N5301s, the first two out were shorted.

The capacitors look good, and allcheck very low ESR, so going to leave them.

Thanks to all for the suggested sources.

From: v44kai@...
Topic: 13086 Message: 13086

Hi all on the group,
I got home this afternoon from work, got in the shack and turned on my ts-940, the TR-7A was on and receiving very well a couple friends were on chatting, I the 940 came on, suddenly the TR-7A started with with a squealing, and didn't stop squealing as it had a feedback in the speaker,

now, no receiving of the signals it was, I wonder if for a brief moment when the 940 came on, it might have transmitted briefly as it was in vox from its last used this morning,

The frequency and antennas for both rigs are closet enough.

If I turned up the volume the squealing feedback gets louder, and the S-meter increases with some static in the back ground,

any idea, experience, possible damage, and of which board, I don't have extenders,

For sure it is not receiving even if I transmit closet to its frequency,

Thanks in advanced,

v44kai.....Joel.

I did the same process on my T4X, but used full strength krud kutter. The knobs are not quite as glossy as others I've seen, so proceed with caution there. Dial is just fine, but get the meter out of the equation. I did the PTO, and it doesn't drift at all now. The cigarette tar just lifted off, no scrubbing at all. Garden hose, outside and a few day back out did the trick. Relube the mechanicals, good to go.

I'll let you know tomorrow!

I'm not looking forward to that SCR. If you've been inside, it's 'wired' in with solid linguini on steroids aluminum. About 1/4" x 1/8"bus bar. I'm going to disconnect what I can without bending anything and get the M^3 on it. If it tests good, it's gonna stay!

I've got to test the TIP-31C tomorrow to make sure its guts haven't been sucked out.

13092. RE: [DrakeRadio] TR7 Alignment

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-11 03:15:11 UTC
From: Jim Shorney
Topic: 13078 Message: 13092

I will make one correction to what I wrote. After adjustment of the 10V regulator, the S-Meter/ACG may need adjustment. If the S-Meter readings don't seem sane, or the AGC sounds mushy, do the S-Meter/AGC alignment (step 3-2). It's pretty simple, you will need a long small flat-blade screwdriver with an insulated shaft. A small LED flashlight will be useful too.

Tap firmly on the radio in various spots. Does the feedback change? You may have "dirty" Molex connectors. Check the +10T and +10R voltages to ensure they are switching properly. If not, a switching transistor on the exciter PCB may be defective.

Gary, yours is in worse shape than mine. I had only one transistor that was shorted.

Gary, the SCR will come out but you are right the connection to ground is rather stout, about 8 gauge wire.
You can desolder the wire from the SCR but you will have to bend the wire. Disconnecting it was really not all that bad.
The SCR is connected to the bottom of the PS with a nut on the bottom outside. There are a few wires that are on the bottom of the SCR and are only ground wires from the filter caps as I remember. Getting the SCR out is messy but doable.
Good luck with it
Harold

I think I found a (the?) problem with the power supply.

On one of the nylon insulators mounting the power transistors to the heat sink, the Emitter lead either melted through the insulator and shorted to the heat sink, or the insulator was either defective or damaged in installation. The insulator has a gap, blackened on the edges, that would have allowed the lead to touch the heat sink. So now I need some insulators! The originals are pretty fancy, with a little handle on the back, etc. Replacements I've been able to find are just a skeleton (+) that should work fine.

This might explain the sizzling sound when it went out.

Hi Jim,

Thanks for responding, I just downloaded the SM for the rig, and will look at the schematics, anyhow I to the cover off and realized the PA was getting warm, and was drawing over 3 Amps, on my 3 Amp Lab supply, I also noticed the plugging relay in the antenna compartment, is engaging when I turned the power switch on,

Removing the jumper in the right bottom corner of the PA decreases that current to just a little over 2 Amps,

The plugged in relay doesn't change when the ptt pressed, only the feed back cuts out,

I will get familiar with the circuit operations and see what I can find,

v44kai.....Joel.

Joel -

AS Jim said, check the +10R and +10T busses. They are marked on the
parent board and MUST 'toggle' from receiveto transmit. You'll
probably find one that is 0 V in R or T. The 'Fusistors' are Q306 and
Q307 on the Transmit Exciter board.

From: Garey Barrell
Topic: 13087 Message: 13101

Success!

I found the originals, Keystone (what else) 4626, and (of course) all
of the distributors only sell a package of 100 at 46 cents each. I
really don't need 96 spare transistor insulators, or want to spend
$46 on them!

Remembering my previous life, I called Keystone's sales department,
explained who I was and what I needed, and five pieces going out in
tomorrow's mail. SAMPLES!

Hi Garey,

Nice to see your response, ok I just check the 10+R and it is doing as it should10v rX and 0v TX, the 10+T is 8.3 in RX and 10v TX, so a switching issue here, will pull the exciter board and have a look,

Thanks Garey,

v44kai.....Joel.

I'm wondering if I am the David that this message applies to, as it did appear in the group shortly after I joined, and my name is indeed Dave.

The idea of Drake equipment was firmly planted in my mind when, as a 14 year-old in England G3EVT, one of my elmers, loaned me his 2B, as I didn't have a receiver of my own. Shortly afterwards, another local ham, G4DSE, put me on the mic of his beautiful Drake C-line station so that I could speak to another teenager in California. Boy was I hooked.

That was in the mid-late 1970's and ever since then, I have thought I would like to have my own 2B one of these days. I am not yet a Drake owner but am still flirting with the idea of owning a Drake 2B.

So if I am the Dave that you were referring to Gary, I would love a copy of the Drake 2B Service Supplement CD. I may not be a very active member of this group until such time as I become a Drake owner, so I have to admit I do feel just a little guilty about this but if it's of any consolation, I love Drake equipment, even though I don't any......yet!

Dave,
I bought Garey's CD when I got my 2-B, and it is worth its weight in Gold! And that goes for the 2-B also. There is something about that receiver that outshines several of my other receivers. Since they seem to be escalating in value, grab one soon before they go the same way as the Halli SX-28...un-affordable.
Welcome to the group...Garey and three or four others are extremely knowledgable on all things Drake...

13108. TR-4 Repair

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-11 20:08:23 UTC
From: slowcountry1
Topic: 13108 Message: 13108

About 10 years ago, I acquired a TR-4 that was in need of repair. I am now finally getting around to working on it. V11 calls for a 12bz6. Someone had stuck a 6bz6 in its place and looks burned up. Is there a direct replacement for the 12bz6? I have a number of tubes on hand however, none of them are a 12bz6.

Regards,

Doug N9XTF

Date: 2013-04-11 20:56:10 UTC
From: Garey Barrell
Topic: 13108 Message: 13109

Doug -

Yeah, unfortunately the 12BZ6 is a pretty rare (expensive) tube. It was used only in Version 4 of the TR-4. The next versions switched to a 6BZ6 which is a much more common tube. Succeeding versions used the 6BZ6 by rewiring the V5 socket (12BA6) in series with V11, and changing V5 to a 6BA6. They're right next to each other so it shouldn't be too difficult to do. Be sure and put a .005 disc ceramic across each filament (Pins 3 & 4).

A 12BA6 will sub for the 12BZ6 if you reverse the connections between Pin 2 and Pin 7, but NOT anidentical tube.

Yes Garey, it has to be a pure white LED flashlight so that brown and yellow photons don't contaminate the Higgs AGCons.

But seriously, use whatever works for you. It just happens that I have a miniature 1 Watt single-LED flashlight that I carry in my pocket wherever I go, it puts a very narrow bright light into dark corners of a radio. It's small size (1 AAA battery) makes it just right to put right next to your eye as you peek through holes in covers and nests of components looking for that one particular adjustment you need to reach.

Hi,

I think I've found a nice TR7. It has a normal SSB filter
and a 300 hz CW filter. I'd like to have an SL-6000 for
SWL but can't seem to find one anywhere. Does anyone have
one they'd like to part with?

Contact me offline via the email address below.

Thanks,

Jon

Garey,

Ok, here come the stupid questions. Pin 2 connects R50 and Pin 7 connects to ground. So I should ground pin 2, remove R50 and connect R50 to Pin 7 and remove the ground from pin 7?

Thanks,

Doug

Jon:

The AM filter is nice for sure, but much harder to find than some of the others.

In the meantime, try this;

AM Filter
An AM filter is almost impossible to find. You can fake an AM 'filter' by putting a 390 ohm resistor through the input and output pins of any blank crystal filter position. It actually isn't bad. What is determining the selectivity is the 48 MHz first IF filter.

Subject: [DrakeRadio] SL-6000 AM filter for the TR-7?

Hi,

I think I've found a nice TR7. It has a normal SSB filter
and a 300 hz CW filter. I'd like to have an SL-6000 for
SWL but can't seem to find one anywhere. Does anyone have
one they'd like to part with?

Contact me offline via the email address below.

Thanks,

Jon

No, the 'other' David was the right one. He had just joined today
about two hours before I saw it. I've been watching since about 995
since I wanted to catch the 'miscreant'! :-)

Maybe this will push him over the edge on a 2-B, and 'nobody can have
just one Drake!.

Doug-

Yes, you need to reverse the connections on Pins 2 and 7. Now 7 goes
to ground and the resistor goes to 2. Just swap them.

As I said, this is NOT a 'perfect' swap and will affect your AVC
action. It's really just something you can use to work on the radio
while you look for a tube if you decide to go for the 12BZ6. The real
FIX is to put those two filaments in series and add the bypass caps,
and replace both V5 and V11 with 6 Volt versions.

Garey,

I wanted to make sure that I was understanding you correctly. I had made the change and then fired the rig back up. When I installed the 12ba6 and turned the rig on, I smoked resistors r53, r71 and an unknown resistor next to r56 on board 8. I replaced the resistors, put pins 2 and 7 back to normal and put the 6BZ6 in momentarily as it had worked previously. I immediately smoked r53 again. I have obviously failed another component that I have not found yet. Do these resistors need to be carbon comp or can one use resistors off the shelf in these locations.

When I started with the rig today, I had no receive or transmit. I was able to get the reciever to work with strong signals and thats when i found the 6bz6. I did not get anywhere near troubleshooting the transmit issue.

Check to make sure the filament wasn't required to accept the 6BZ6 first.

Steve

I'll have to check it but given how bright the 6BZ6 was lit prior to removing it and then When replaced after trying the 12 series tube I'm sure it's wired for 12 volts. It was very bright. The glass on the 6bz6 was blackened as well.

It's funny you mention that Gary, as I have just spent the last hour browsing the regenrx group. I'm planning a little regen project.

However, even though it wasn't really in the budget, I think I might also keep an eye open for a 2B in nice condition at the right price. I'd like to crystal it up for a few of the SWBC bands too. It strikes me that it'd make a really nice RX for SWBC listening too.

Look what you've started Gary :-)

Bernie -

I've seen Garey's site before when browsing the internet for things Drake, and his Service Supplement CD's certainly do look very useful and informative. It will make me feel a lot more confident about being able to keep my 2B in good working condition.

Not that I'm about to get one but, well, you never know. It's really not in the budget right now but if I were juggle a few things around and look at the situation from a different perspective......

Dave
AA7EE

> Dave,
> I bought Garey's CD when I got my 2-B, and it is worth its weight in Gold! And that goes for the 2-B also. There is something about that receiver that outshines several of my other receivers. Since they seem to be escalating in value, grab one soon before they go the same way as the Halli SX-28...un-affordable.

That is a version 8 of the TR-4, one of the last made. The highest s/n
I'veseen is 328xx, and the TR-4C started at 34000, leading me to
believe that the 33000 block was skipped. Perhaps they didn't want
to start on an odd number! :-)

Does that unit have a plug-in relay under the chassis, or the wired-in
relay near the power connector?

13127. TR-4 repair re 6BZ6

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-12 19:41:45 UTC
From: John Sehring
Topic: 13127 Message: 13127

RCA shows a 6JH6 as a sub for a 6BZ6--it sez so right on the tube carton.

No 12JH6 is listed in RCA RC-29 (1973) Receiving Tube Manual. Oh well. But there is a 4JH6 for use in B&W TV's.

I think I would prefer (I haven't had to do this--yet) to add a series resistor to bring fil voltage down to 6.30 V. Seems like the least critical way.

Yes, I like my filament voltages spot on. Tubes laster longer & work better that way.

John -

Generally, I would agree with you. The 6JH6 doesn't come up in my sub guidebook, but IS an 'equivalent' tube. Good info!

However, the change in a TR-4 would be so simple, the tubes are practically next to each other, and Drake 'corrected' the situation the same way in the next version. The R-4 series receivers also started off with a 12BZ6, plus the 2-C. The R-4B finally changed to a 6BZ6, and the second version of the 2-C also changed. There were LOTS of R-4 and R-4A changed, because the 12BZ6 was rare and expensive even then. Fortunately all the receivers had center-tapped filament windings, and there was6V on a tie strip right near the tube.

Hi John,

The 6JH6 is a direct substitute for the 6BZ6. Both are available through the e-Bidding site!
Possibly a little costly but easily obtainable. The 6BZ6 do seem problematical as they often suffer inter grid leakage so perhaps a 6JH6 would be worth a try.
The 4JH6 because of heater supply of 4.2v @ .45A would require a series dropper of 4.67 ohms but the valves do seem cheaper.

Yes, the 6JH6 or 6BZ6 are readily available frommultiple tube sellers,
as is the 12BZ6. The 6BZ6 typically goesfor about $3, the 12BZ6 for
$9. If you want to pay twice that and more, you can buy them on eBay!

That explains why the desiccant bags in those PTOs are almost always pink.

Garey,

I visited a forgotten about old TV repair shop today and acquired the appropriate carbon comp resistors to replace the burnt units stated previously. In addition, I obtained 10 each 6BA6, 12BZ6 and 12BY7A old stock tubes. I could not remember what other tubes were in the radio, so I did not get those, but plan a return trip. I paid $1.00 per tube, was well worth the trip.

I replaced the resistors and placed the 12BZ6 in service. The receiver now works pretty well, a little low on sensitivity, but not bad. I am however unable to get the unit to transmit. All tubes are lit. I can turn the switch to CW Tune and set the bias for 100ma. If I set the switch to X, I am unable to obtain any plate current. Both relays close and I get the CW tone however; it is very quiet. The relay in the PA cage has been replaced with a board and an enclosed relay and the "protection bulb" is gone. It appears that the old open frame relay was replaced by a factory upgrade? Can you point me in a direction to start troubleshooting the transmit issue?

Thanks,

Doug N9XTF

Doug -

I would say it was well worth the trip!! :-) Did you buy all of those tubes?

If you get nothing in the -x position,how about receive? When you turn on the Calibrator, and tune from below it,through zero beat and above it, you should begin to hear a highpitch tone, decreasing to zero beat, and very little tone above zero beat. Then tuning back low, switching to the other SIDEBAND and then tuning higher in frequency again you should hear little or no tone, through zero beat and then an increasing pitch up to 2500 Hz or so. Think of the letter "M" with zero beat in the valley 'middle' and then depending upon which filter you select you should hear ONE of the peaks.

Let me know what you get!

Gary,

Yes, I purchased all 30 tubes.

Yes, I'm able to set the switch to Cal and I have the Cal tone I can run through on both USB AND LSB. The zero beat acts just like it does on my TR-4Cw.

Garry,

I forgot to mention that the audio output seems low to me. I have to set the volume to about 12 o'clock on a reasonable signal to have it at the correct volume. My 4Cw is about 9 o'clock or less.

13136. Re: TR-7A howling in speaker, no RX

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-13 03:38:16 UTC
From: v44kai@...
Topic: 13086 Message: 13136

I started work again tonight, on the TR-7A, all transistors on the exciter board are good, I did a couple elimination surgery on the parent board, and all indicate the 8.3v on the T10+ buss in RX mode is coming from the up-converter board,

The manual I downloaded is missing a page or two, I only have the first page of the schematic, I'm not seeing the T10+ and some other terminal lines, anyone have the complete section for the up-converter board? I will appreciate a copy,

Thanks in advanced,

v44kai.....Joel.

13140. TR4 & RV4 & AC4 what are they like, desirable?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-13 05:58:58 UTC
From: zl1bbw
Topic: 13140 Message: 13140

I am looking at a TR4 RV4 AC4 combo that looks in pretty good condx, reported that it is working on 40 not tested on other bands.

Is this a desirable combo in the terms of Drakeology? I have a B & C line already, and like an idiot in a moment of financial strife let 4NT go, silly day.

The serial number is in low 27k series has a black pa cage, copper chassis, the dial has the skirt with khz around it, no noise blanker.

Any idea what is worth/desirability is? and how do they perform? thanks

Found CR403 on up-converter board leaky, I have no such PIN diode in stock,
what is a close fit for this to common diodes 1N914 etc ?

v44kai.....Joel.

Joel -

That is acommon PIN diode. They are available from several eBay
suppliers. You 'could' use a 1N4007 as a temporary sub to continue
troubleshooting.

Doug-

I don't think I know the s/n of your TR-4. Versions 7 and 8 added a
single transistor AF preamp for increased audio. This is about s/n
30000 and up. Of course it was carried over to the TR-4C, all versions.

13145. Re: [DrakeRadio] TR4 & RV4 & AC4 what are they like, desirable?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-13 14:23:40 UTC
From: Garey Barrell
Topic: 13140 Message: 13145

If it's between 27000 and 27500, (low 27k!,) it's a version 4. That's what I call a TR-4B. There never wassuch a classification from Drake, but it had the cosmetic features of the B-Line twins. Black lettering, FET PTO, neon fiducial for 'PTO in Use' indicator, two SSB filters, etc. Small changes from that point forward until the 30k range when the one transistor AF preamp was added.

So for a TR-4, pretty good. Most of the bugs were gone and only minor changesthrough until the TR-4C.

Garey,

SN is 26095.

I'm tracing down as much as I can find and still cannot get the 6jb6's to draw any plate current.

> the one transistor AF preamp was added.

As just another data point, my TR-4 (27521) matches this description,
and as best I can tell is a "TR-4B" above 27500. The PA cage is in
the white, however. It also has a plug-in relay on top of the
chassis, with (as I recall) the socket mounted from below the chassis,
although I'd have to check that to be sure.

I know you and some others keep S/N databases, I'd be happy to check
features and provide any info you might be interested in.

I should have replied to the OP, too! My TR-4 is 27521, as I
mentioned to Garey, and I love it. It's my daily driver. As I'm sure
many people on the list will tell you, if you're a CW operator you're
going to find the unmodified selectivity a little lacking -- but for
phone, it sounds good, operates easily, is tolerably stable, and
brings back a lot of "oh I had one of those XX years ago, that was a
great rig" nostalgia on the air. ;-)

> Any idea what is worth/desirability is? and how do they perform? thanks

I believe I paid $250 or $275 for a TR-4, RV-4, and AC-4 about two
years ago at a local hamfest, in unknown working but very good
cosmetic condition. I think this is on the low side of an average
price, $250-350 seems plausible to me unless it's a real gem or has
been gone through by a technician you trust. Auction prices often run
quite a bit higher than that, that's a hamfest or face-to-face sale
price. Others may have different opinions and experiences, of
course... I'm in Indiana, so the Drake rig population is thick here.
Not southwest Ohio thick, but maybe thick enough to moderate prices.

Ethan

13150. Re: FS: Ready to Play TR4 System

Hi Garey:

If I recal, it is wired in Ry. I can double check if I need to take it out of its cover again.

It is just a stunning sounding Rx on SSB...

I really hate to sell it but have so many other things going on with 2M EME, and AM Bcst transmitter project, etc, It rarely gets used...and I can use the desk space..better to have it go to someone that will run it more often than I can right now..

From: slowcountry1
Topic: 13108 Message: 13151

I took the following voltage measurements at the pins of the 6JB6s. Bare in mind that the measurements may be useless as I only have a Fluke 289 DMM.

First Number is receive and second is in CW-X and X position for transmit.

1. 250.74 244.11
2. -55.82 -55.20
3. 156.03 0.67
4. 6.5 VAC
5. 12.64 VAC
6. -55.84 -55.22
7. 249.5 242.9
8. NC
9. 156.1 0.263

All tubes are lit. I can turn the switch to CW Tune and set the bias for 100ma. If I set the switch to X, I am unable to obtain any plate current. Both relays close and I get the CW tone however; it is very quiet. The relay in the PA cage has been replaced with a board and an enclosed relay and the "protection bulb" is gone. It appears that the old open frame relay was replaced by a factory upgrade? Can you point me in a direction to start troubleshooting the transmit issue?

Ok Garey, thanks,

I have 1SS133 these should work also as they are fast switching, but will look around here and see what I can find in the junks radio box,

Yes sub as you to continue T-Sing,

v44kai.....Joel.

I would use the 1N4007 as Garey suggested, if you can find one. The 4007 has a PIN diode structure (the only one of the 1N4000-series that does, I am told). An "ordinary" switching diode may not work well. Let us know, either way.

The only voltage that is off here is the cathode
voltage (pin-3) in receive. The plate current meter actually
reads cathode current so I wonder if the lack of indication
is due to something in the metering circuit. I think you
wrote that the T-R relay had been changed. The meter is
switched from RX to TX by this relay. Perhaps its not
connecting. There are two shunts on the meter for TX, R-45
and R-13, which is in parallel as a trimmer. One of them
would have to short to get zero indication and that is
unlikely, usually they go high. I suspect the relay.

Ethan -

All the remaining TR-4s were "B"s. None of the TR-4s had plug in
relays, but Drake did sell a retrofit kit with a small PC board that
fit over the chassis feedthroughs and accepted the standard
R10-E1-Y4-V2.5k relay. Version 7 added the NB socket and frontpanel knob.

Doug -

Do you have 650VDC onthe PA plate caps? If you DO, then the tubes ARE
drawing current (unless they're both defective) and the problem is in
the metering circuit.

From: Garey Barrell
Topic: 13086 Message: 13157

The 1N4007 is a better sub, as it IS a PIN structure diode. It is in
the signal path right at the front end, so a common diode may be
problematic.

Garey,

I have 679VDC measured at the top of all three 6JB6 tubes.

Doug

I thought to ask this also but he was getting so much
cathode current that the plate voltage _had_ to be there. I
don't think the screens could draw that much current, at
least not for long.

Garey,

Garey Barrell spake unto us the following wisdom:
> All the remaining TR-4s were "B"s. None of the TR-4s had plug in
> relays, but Drake did sell a retrofit kit with a small PC board that
> fit over the chassis feedthroughs and accepted the standard
> R10-E1-Y4-V2.5k relay. Version 7 added the NB socket and frontpanel knob.

Thank you for clarifying the "B" situation. Mine is too old to have a noise blanker socket or knob. I rather wish that Drake had included revision numbers somewhere! Of course, by 2013, so many rigs have had various hands in them that who knows what you may find, anyway...

I remembered a nice, large, rectangular hole in my chassis under the relay, so I went and looked to see what I was recalling. Mine does have the PCB conversion that you mention. There is indeed a large (maybe 1" x 1.5" or so) rectangular hole, but it is not precisely under the relay and it just has two or three wires passing up through it. Perhaps it was used for something before the conversion? It appears that the conversion in my TR-4 was not performed by the factory (if they even offered such a service), as the soldering job on the PCB looks a bit dodgy compared to the rest of the rig, or my other Drake items. (Though my 2-NT has some skechy work in it, as well, perhaps the aforementioned various hands have been mucking about in it!)

Ethan

This afternoon my L-7 has decided to get really noisy in the fan department, without looking into this is there a drop in quiet replacement available?

Doug -

OK. Well, again, the tubes ARE drawing current. The Cathode voltage tends to float up with the return is lifted, (relay in Receive,) and go to near 0 when the relay goes to Transmit. Either your meter is defective, or the meter shunt (R45) is shorted, or the meter switch (front panel) is defective.

I would try exercising the switch to see if it's just not closing in the Plate position (pushed in).

OOPS! The front panel meter switch should read PLATE current in the
OUT (spring driven) position.

73, Garey - K4OAH
Glen Allen, VA

Drake 2-B, 2-C/2-NT, 4-A, 4-B, C-Line
and TR-4/C Service Supplement CDs

carbon comp resistors to replace the burnt units stated previously. In addition, I obtained
10 each 6BA6, 12BZ6 and 12BY7A old stock tubes. I could not remember what other tubes were
in the radio, so I did not get those, but plan a return trip. I paid $1.00 per tube, was
well worth the trip.
>>>>>>>>>
>>>>>>>>> I replaced the resistors and placed the 12BZ6 in service. The receiver now works
pretty well, a little low on sensitivity, but not bad. I am however unable to get the unit
to transmit. All tubes are lit. I can turn the switch to CW Tune and set the bias for
100ma. If I set the switch to X, I am unable to obtain any plate current. Both relays close
and I get the CW tone however; it is very quiet. The relay in the PA cage has been replaced
with a board and an enclosed relay and the "protection bulb" is gone. It appears that the
old open frame relay was replaced by a factory upgrade? Can you point me in a direction to
start troubleshooting the transmit issue?

13164. Re: TR-4 Repair (oops!)

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-13 18:47:55 UTC
From: slowcountry1
Topic: 13108 Message: 13164

Garey,

I put a know good set of tubes in the rig, no Tx output on wattmeter. I changed out the enclosed relay with a new one. No output on wattmeter.

Any other ideas?

Thanks to all on the list for the assistance.

Doug.

From: Chgypsy@...
Topic: 13165 Message: 13165

Hi, If I recall correctly Evan of linear renown, has had a series of emails at various times on both this list and on the other Drake list about both L4 and L7 fans and what he was using to replace them, sources and models.
Carl wd8nhk

Doug -

Again, the problem is NOT with the tubes. The relay IS closing as
evidenced by the Cathode voltage reading on the PA.

Either the panel switch is not closing in the 'normal' OUT position,
the meter is defective, or the meter shunt (R45) is shorted or
associated wiring is incorrect.

With the applied (measured) PA tube voltages you provided, the PA
tubes ARE drawing current. You may have other signal problems, but
until you can set the PA idle current to 0.1A with the BIAS control,
you are not going to get any output.!

13167. Re: TR-4 Repair (oops!)

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-13 19:27:24 UTC
From: slowcountry1
Topic: 13108 Message: 13167

Garey,

I have not had any issue setting the bias to 100 ma on the plate meter or .1 When I switch to CW-tune and the other switch not in the X position, I can adjust the bias up and down without issue and then hit .1 as required by the manual. This is the first step I did when I started working on the receiver section.

Thanks,

Doug N9XTF

From: Garey Barrell
Topic: 13108 Message: 13168

Doug -

OK, I guess I missed that. Based on your measurements I calculate 96 mA so that's pretty close! :-)

So. Refresh the problem.

If you switch to CW-TUNE, in the non -X position, you can adjust the BIAS correctly.

If you switch to -X, key the transmitter (or unplug the key) do you see the idle current? If you increase the XMTR GAIN and peak the RF TUNE control do you get any increase in plate current? If you are on 40M, with the PTO set to 7000 do you hear a signal at 7.000 on a separate receiver? If you DO heara signal at 7.000 peak the RF TUNE for maximum signal onthe receiver.

73, Garey - K4OAH

Date: 2013-04-13 20:10:54 UTC
From: slowcountry1
Topic: 13108 Message: 13169

Garey,

With the switch in CW-Tune and the sideband switch in the non-X position, I can adjust the bias to .1. When I set the switch to CW-Tune and the sideband switch to X together, I see .1 on the plate meter, no change. I can increase the xmtr gain and peak rf tune and there is no change is plate current and no output on the external wattmeter.

I set my FT-847 to 6.996.420 CW Mode and the TR-4 to 7mhz dial on the 40 meter band switch. If I set the sideband to the non x position and the other switch to X-CW I hear a strong tone on the 847. If I also switch the sideband switch to X, the signal strength on the 847 increases. Peaking the rf tune in either mode produces a stronger signal on the 847.

Just to clarify this, is the wattmeter an external one
or the tuning wattmeter in the receiver?

Also, if I understand correctly, you can set the
resting current on the finals with the bias adjustment but
do not seen plate current when transmitting, is this
correct?
I am also not sure if you get no power out in any mode,
again the means of measuring the output is important. I was
mistaken about the relay contacts in the meter circuit. It
was an optical illusion from looking at the schematic on my
computer. The relay is shown below the meter switch for
plate current or output. This switch could be bad which
might account for the meter not working at all, as would a
bad meter but the meter is OK if you can read bias. It
might account for not seeing output if you are not using an
external power meter but not otherwise.

Richard,

Setup is as follows;

TR-4 connected to a W4 wattmeter connected to either a dummy load or Hustler 5BTV. I am watching the external wattmeter for power output from the TR-4. When I switch to X-CW and sideband to X, the rig keys, the plate current meter shows .1 and does not change with xmtr gain adjustments and rf tune adjustments; no output is seen on the external W4.

Placing the switch in x-cw and the sideband switch in the non x position allows me to set the bias current to .1 on the plate meter.

Regards,

Doug N9XTF

Doug -

OK, that's good. So we have a signal, we just have to amplify it and
get it to the PA!

Check the DC voltages on V6.

OK, thanks, I was somewhat confused because there have
been a lot of TR-4 posts lately. Is this the same one that
had the wrong tube in it? If so I wonder if that has
anything to do with this.

Thanks for all the info. The s/n is 27012 or near that, so sounds like a "B" am mainly CW but use the B line for that.

A friend in the UK keeps on at me to buy some new gear, but it is so expensive in NZ its unreal and no back up service of any value, so why should I get a FT1000 or better at 10 times the price and zero times the repairability. Reckon the best place to spend money is up in air on antennas. Will see if I can catch this one, and report back.

A good Datong audio filter sorts out many of the audio issues.

Also not a great Ham population up here, think I am the only one on HF within 30 or 40 miles, so no nearby problems.

Garey,

Driver tube V6 voltages as follows;

1. 157 2.8
2. 0
3. Not connected
4. 0
5. 0
6. 6.408 VAC
7. 252 236
8. 253 164

First number receive second number transmit.

Regards,

Doug N9XTF

Hi guys,

Found some 1N-4937 that I use to use in my TV and VCR repairs, a long time ago, they are Schottky rectifier fast speed switching, that worked so far, and the receiver is back to life,

I will run the rx a while before I connect back the components in the PA unit to make sure that the PA works, will keep you'll updated,

OK, DC levels look good. Check voltages on V4. This should eliminate
any DC problems.

V11 is in the receive IF, and V5 is the Calibrator, so no transmit effect.

You won't know until you check sensitivity, but certainly good enough
to keep troubleshooting!

Ok good Garey, I should have a few 4007 somewhere, will look later tonight when I returned home, remember Garey I can't nowhere on the island to purchase electronic component,

Thanks,

V4

1. 160 2.0
2. 0
3. NC
4. 6.35VAC
5. tied to ground
6. 0
7. 226 230
8. 161 148

First number receive second number transmit

The AC voltage on pin 4 is not supposed to be on this pin according to the TR-4 manual. It is supposed to be on pin 5 according to the manual. It does not appear to be tampered with.

Regards,

Doug N9XTF

Doug -

OK. Looks good. We're getting down to things like coupling capacitors. Do you have, or have access to a scope? An RF probe would do. We need some way to check and compare signal strengths.

Pins 4 and 5 are the filament pins, so as long as one is 6.3 and one is ground, we're ok.

From what we've found so far, all stages seem to be working, just not enough gain. Try tuning on 80 or 20, and see if you notice any difference. Peak RF TUNE, PLATEand LOAD controls on each band while listening in the receiver and confirm thatthey all 'tune' or peak when varied.

73, Garey - K4OAH

Garey,

I do not have either a probe or a working scope (couple of defunct military ones lol). I may be able to borrow one next week. I will check signals on other bands tomorrow. Any pointers on what capacitors may be at issue, I could check and or replace in the interim?

Thanks for all your help!!!

With all the help you dedicate to this list, when do you actually get time to operate your gear???

Doug N9XTF

From: dickbolt@...
Topic: 13185 Message: 13185

I finally decided to part with my Drake FS-4 Synthesizer & soon the SPR4 that goes with it. It seems I did not put it on ebay correctly as its not in the Drake section of Ham Receivers!

http://www.ebay.com/itm/Drake-Radio-FS-4-Frequency-Synthesizer-/111049376198?pt=LH_DefaultDomain_0&hash=item19db0f01c6

Doug -

What we needto dois check that signal from V4, should be about 6V p-p on the Plate. The coupling capacitors are C41 and C61, but I wouldn't recommend replacing them until we can look at the signal levels. No point in injecting another variable into the system. We should get about 150V p-p on the Plate of V6.

Have you gonethrough the alignment procedure for T7 throughT10, using the separate receiver, to ensure that they DO resonate (tune for a peak) where they should? Try on more than one band.

Also, I don't recall if you have done the 'tighten all the ground' hardware process. Go through and put a screwdriver on every screw that makes a ground connection, tube sockets, terminal strips, shields, etc. If tight, loosen a quarter turn and then tighten again.

13190. Re: L7 Linear fan, Drake Forum at Hamvention, etc.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-14 15:44:59 UTC
From: k9sqg
Topic: 13161 Message: 13190

Fellow Drake Enthusiasts,

Yes, the fan replacement for the L7 linear has indeed been a saga for me, hi hi. Not so much the actual process of replacing the fan but rather determining that the fan itself was defective. After replacing a defective fan with a new one, improved version with ball bearings rather than sleeve bearings, there were subsequent failures with it and additional fans. After replacing the fan(s), thermostat, dropping resistor, and even the wiring I eventually determined that it was the new fans that were also "defective". How could this be?

Based upon phone conversations with several distributors as well as factory representatives, I formed several conclusions. First, the company had changed hands more than once. As a result, model numbers, specifications, and components themselves underwent several changes. Second, the TA-450, TA-450S, etc. became more of series numbers rather than actual product numbers. So the former model number and voltage rating were no longer a way to identify the specific fan that was needed. One needed to know the specific model number (e.g. A7388--, etc.) when getting a replacement. Third, because of changes in manufacturing processes, the lubricant used for the bearings changed, intentionally or accidently, not sure which. In some applications this would go unnoticed but when exhausting hot air from a linear, the lubricant would flow and fail to lubricate properly thus resulting in the fan slowing and eventually stopping. Letting the fan cool would enable normal operation.

Bottom line, proceed with caution and be aware of possible problems resulting in fan failure. As a result, I have located some fans that have worked successfully for me in this high temperature application. Issues of concern are CFM rating of the fan, noise level, and impedance (if not close to original fan, changing the value of the series dropping resistor might be warranted).

I went through a similar process with selecting external fans for the L4, L4B, and L7 power supplies. More recently, I devised a way of adding an internal fan to the respective power supplies.

All of the above were discussed in detail during the Drake Forums at Hamvention. Videos are available at the VIMEO website.

Enjoy those Drakes! And yes, there will be a Drake Forum at Hamvention 2013. There will be handouts of collectable pens with the Drake logo for the first 100 attendees, hundreds of dollars of free door prizes, and some interesting presentations. You are invited to attend the Drake Forum on Saturday of Hamvention weekend, 10:30 to 11:30, in Room 2, same as last year. Typically the room is packed with standing room only so please consider arriving early. Safe travel my friends.

From: greenmoldydonuts
Topic: 13191 Message: 13191

A bit ago the subject of quigs came up, I found it fascinating, usefull, and found them to be extremely rare. While browsing through a large sporting goods store, I found something called "Wire Leader Connector Sleeves" made by Berkley. They only had the #3 size available, but for $2.49 a pack of 33 I just had to try them. The diameter is too small to overlay the two wires inside, but at 3/8 inch long, one can shove one wire in half way, pinch with a needle nose to hold it, shove another wire in half way from the other side, pinch with a needle nose, and solder both ends. The sleeve does not appear to be stainless steel or nickle plated and will readily take solder. A suitable substitute for the traditional spring-type quigs.
The funniest part was when I went to check out, the well-trained in "up-selling" clerk asked if I needed leaders or leader material for these. I replied, "No, I'm using them in a ham radio!" I guess I never dreamed I looked like I was from outer space!!

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

Evan,
I read this with interest, does the fan have tags or is it wired, I ask this as it is very difficult to remove the linear from where it is placed at the moment and although I can probably get a replacement fairly quickly I really do not wish to dismantle half the shack to get to it. I have looked at several options from RS and Farnell, ball bearing versions around 100cfm with 48dBA noise level and 220mA current rating apart from the high current the other specs are close to the original. I did find a link to the TA450S fan which says it is ball bearing http://www.network-server-parts.com/ta450s-nidec-torin-alpha-v-ball-bearing-fan-p4503039010.html this leaves me a bit puzzled as you say the original is sleeve bearing?

Hi Aldo,
I think all the R-4/T-4/TR-3,4 series cabinet paint is the same. I've used Rustoleum Satin Black, no. V-7777 on many of them with excellent results. It's possible they've changed the no. recently, it's been abt 2 yrs since I've bought any, and they seem to have expanded their offerings a-la Martha Stewart, e.g. Chocolate Jamoca Fudge, etc.

13199. Re: [DrakeRadio] Drake FS-4 On Ebay

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-14 19:27:51 UTC
From: Charles Ring
Topic: 13185 Message: 13199

The SPR-4 might be different, but I'd like to know the result of putting an FS-4 on 5.0 MHz to cover 60 meters (receive only), on a R-4x. Is it locked out on the FS-4? Does it work? That should tell me what to expect if I get a crystal to cover 5.0 to 5.5 MHz on my R-4C. I know to not try to transmit there with the 4 line.

13200. Re: [DrakeRadio] Drake FS-4 On Ebay

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-14 19:30:40 UTC
From: Garey Barrell
Topic: 13185 Message: 13200

Either way will 'work', but there will be LOTS of spurious signals.
Definitely 'Receive ONLY'.

73, Garey - K4OAH

Ok Garey,

The 2879 I think used in the ts 430/440 I should have a couple, will look
in my stock, is the Bias the same for the 2879?

Thanks,

v44kai.....Joel,

Well I can tell you all that I did Aldo.

I put the cabinet only in the dishwasher, washed it. Of course all the dirt and some paint came off and there was peeling paint on the cabinet. I found at the local hardware some very fine sandpaper and sanded the cabinet where the paint had peeled and once finished cleaned the cabinet again to get all the paint dust from sanding off and then proceeded to put a light coat of paint on. I had to apply about three coats, just a little at a time, let it dry and then apply again. There is no spackled part if you mean the little impressions on the case, I could not see how to do that maybe someone else can help.

Aldo,

I have been using Tremclad Semi-Gloss on my TR-4, Drake twins, and one PS enclosure with excellents results. Hard and resiliant. Holds up over time. Looks great. I wash the encloures in hot soapy water and rinse thoroughly. Pat dry with paper towels, blow dry with a hair dryer and let stand. Be sure the area inside the folds are thoroughly dry. Before I wash, I remove any rust in the scratches or elsewhere with a fine abrasive.

Follow the Tremclad instuctions - for example, apply second coat within one hour, then only after 48 hours. This is important. Hope this might help. Good luck with your TR-4C.

From: k9sqg
Topic: 13161 Message: 13210

Max,

The original fan has terminals, as if a connector could be used, BUT the wires in the L7 are tack soldered to those terminals.

Replacing the fan is tricky. Why? One has to be very, very careful when dealing with high vacuum tubes like the 3-500Z. Safety glasses should ALWAYS be worn when working around those tubes. The tubes should be removed when replacing the fan.

The fan housing and wires are not difficult to remove. However. you might have to make arrangements to support the fan while removing or adding the wires. Small boxes, books, or "painter's tape" can be used for this purpose. Also, during re-assembly, each bolt and nut should be loosely attached until all are inserted, then they can be tightened.

As to what is a ball bearing versus a sleeve bearing fan, I have difficulty answering that question. I have just been going with what a factory rep told me. I don't know if it was accurate or might have changed from the various production runs. In fact, I have not found conclusive documentation that specifically defines how the TA-450 differs from the TA-450S. I wish I could clarify the matter but have been unable to do so.

73,

Evan, K9SQG

--- In DrakeRadio@yahoogroups.com, "Max Cotton" <AirRadio@...> wrote:
>
> Evan,
> I read this with interest, does the fan have tags or is it wired, I ask this as it is very difficult to remove the linear from where it is placed at the moment and although I can probably get a replacement fairly quickly I really do not wish to dismantle half the shack to get to it. I have looked at several options from RS and Farnell, ball bearing versions around 100cfm with 48dBA noise level and 220mA current rating apart from the high current the other specs are close to the original. I did find a link to the TA450S fan which says it is ball bearing http://www.network-server-parts.com/ta450s-nidec-torin-alpha-v-ball-bearing-fan-p4503039010.html this leaves me a bit puzzled as you say the original is sleeve bearing?

This is the article of which Garey speaks:

http://www.wb4hfn.com/DRAKE/DrakeArticles/TR7_Amp_Repair/TR7-Amp.htm

I did this work to my PA deck a few years ago, with good results. However, I believe the higher gain of the new devices brought out the instability that causes the PA in some TR-7s to oscillate in the 40-Meter band segment when the power output is set to spec. There are two fixes to this: set the maximum power to a lower level via the ALC adjustment in the bottom of the radio, or install a PIN diode attenuator to level the gain across the bands. I've spent hours experimenting with negative feedback levels in the PA deck, and have not come up with a reliable solution that way, nor have I found a way to break the feedback path elsewhere. Bob Loving designed a stripped-down version of the PIN attenuator board that lowers the system gain on the low bands only, I'm going to try that the next time I have my rig on the bench.

From: slowcountry1
Topic: 13108 Message: 13212

Garey,

Here are today's events; this may or may not reveal any useful information, but here it is;

I went through and bear nut tightened every nut and screw that I could find. I backed them off first before tightening. I went though the alignment for T-7 through T-10. I noticed that peaking T-9 20 meter part did not hold. Following this, I attempted to tune up the rig on 80 meters. The plate meter pegged with the XMTR gain fully counter clockwise, I had to advance the XMTR gain to get the plate current to come down; I was then able to tune 200watts. I experienced the same plate pegging on 40M and 20M but was able to settle it down and achieve 200watts. I figured it was some type of oscillation as I had the PA cage off the rig and had not yet adjusted the tube neutralization. After I reinstalled the cage, I am no longer able to draw any plate current, above resting current, or derive any output power on my watt meter.

I went back and checked the T-7 through T-10 alignment and found that 20M was down again, I attempted to re-peak it however T9 had no effect and noticed the top adjustment screw felt funny. I flipped the rig over and noticed that someone had been here before. There was new solder and someone had done a very poor solder job. I do not know how I missed this previously as I had checked it over pretty well; at least I thought I did. I don't know if they replaced T-9 or if they replaced a cap or what, but there definitely had been some work done.

I removed T-9 and pulled the can off the assembly and found that the ferrite material was busted up inside the adjustment tube. I then replaced the unit with one out of a parts rig. I re-did the alignment and now T-9 top has to be screwed all the way in to show an increase in S-Meter reading; where it did not have to before. The other oddity is that the other "cans" when you tune past the sweet spot, the S-meter drops off; where T-9 will not do this. I can not peak the s-meter on 20M anywhere near the s-meter level as when I started.

I attempted to tune up again on 80M with the PA cover off and I am back to the starting point, I cannot develop any plate current above resting current and cannot derive any output power.

Here is an interesting tidbit that may or may not be useful. I accidently switched to my 10M antenna just before breaking for dinner. I attempted to tune up one last time on 80M and all of the sudden the plate current went from resting to .15 or .2 and the wattmeter indicated 50 watts or so output. Adjusting the plate and load capacitors would not produce any additional power but it acted like it was tuning. This is when I noticed that the wrong antenna was selected.

One last question in the puzzle, on the underneath side of the rig, there is a small tuning coil, I believe its L7; this is on the wafer next to T-9 underside. The pictures show it as a tuning slug however it is just a coil of wire with no slug in the center. The coil is split in about the middle with a small kink in it. There is a similar coil on the next wafer closer to the front of the rig that is not split, so I attempted to straighten L7 up as much as possible. How is this coil supposed to be?

Regards,

Doug N9XTF

I may be able to borrow one next week. I will check signals on other bands tomorrow. Any
pointers on what capacitors may be at issue, I could check and or replace in the interim?

When I switch to CW-tune and the other switch not in the X position, I can adjust the bias
up and down without issue and then hit .1 as required by the manual. This is the first step
I did when I started working on the receiver section.

Hi Rich,

Directly above the bar code is the number associated with Tremclad Semi-Gloss. It is 270S26B522. The Barcode Number is 6321300541.

Tremclad is a Rustoleum product.

The only abrasive I use is the kitchen variety 3M souring pad - when washing the enclosures.

Vy 73,

Matt Newman, VA3MGN/AA1VN

> I have been using Tremclad Semi-Gloss on my TR-4, Drake twins, and one PS enclosure with excellents results. Hard and resiliant. Holds up over time. Looks great. I wash the encloures in hot soapy water and rinse thoroughly. Pat dry with paper towels, blow dry with a hair dryer and let stand. Be sure the area inside the folds are thoroughly dry. Before I wash, I remove any rust in the scratches or elsewhere with a fine abrasive.

13215. Parts R-4C? Need audio transformer

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-15 14:45:25 UTC
From: drelectrode
Topic: 13215 Message: 13215

I'm new to the group. Just picked up a very nice later version R-4C on eBay but it turns out to have a blown audio transformer. I've never run into that before and was wondering if anyone knows of a source for the part or if there's someone out there who specializes in Drake repairs and might have parts radios. Thanks much in advance for the help.

13216. Re: Drake FS-4 On Ebay

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-15 15:25:08 UTC
From: Bill Breeden - NA5DX
Topic: 13185 Message: 13216

Gary,

I completely agree. I purchased an FS-4 new in the late 70's. Used it with an R-4B for tropical band DXing, Utility DXing, general shortwave listening. It was the only disappointing product from Drake that I ever owned and a definite downgrade from band crystals in the 4 Line. In addition to the noise that came over on the cable to the crystal sockets, it radiated lots of garbage from the AC cord that my wire antenna could hear. I was able to reduce some of the radiated noise by adding bypass capacitors to the AC cord, but not nearly enough. Still have an R-4A, an R-4B and an SPR-4, but no FS-4.

73,

Bill - NA5DX

13217. Re: [DrakeRadio] Parts R-4C? Need audio transformer

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-15 15:28:07 UTC
From: Paul Christensen
Topic: 13215 Message: 13217

Larry,

I would seize the opportunity to upgrade the R-4C's audio path and take time in finding a replacement transformer to keep on hand in the event of a future sale. Of course, if the R-4C is in mint condition, any mod should be made so that it's reversible with no "residue" left behind. There are several possibilities:

1) Use Sherwood's AMP-4 kit. Or, build your own using a LM380/LM383/TDA-series audio amp. When using any of these devices, my experience has been that hum/buzz rejection is greatly improved with wiring care, but residual hiss may be objectionable when using modern headphones. You can use an in-line headphone attenuator and dial-in the amount of attenuation that reduces hiss to an acceptable level. Of course, as a trade-off, the amp is working harder and the source Z into headphones increases but this is rarely a problem. Radio Shack and on-line sources sell these. Any of the changes below will also result in reduced cabinet heating.

2) Through a coupling cap, bring the AF Control wiper arm out to a spare rear panel RCA jack (or pig-tail jack to avoid drilling a hole). Then use a high quality external amp like a used Marantz;

3) Construct a simple push-pull audio amp using low-noise transistors. For ultra-simplicity, I like the KK7B design that uses headroom boosting emitter caps. See http://www.qrp.pops.net/af-amp-2008.asp ;

4) Construct a low-noise, precision Class-AB amp using one of several designs. Generally, these designs use 2-3 biasing diodes to allow a small amount of collector-emitter current to flow in the absence of an input signal. These designs run very cool and have very low noise/distortion characteristics, owing to the use of the diodes and low-noise-figure transistors in the high-gain stages. I'm using the SM0VPO amp design. The circuit board is available from FAR Circuits and component values as well as the schematic are available on the SM0VPO website.

If you primarily use modern stereo headphones, consider replacing the mono headphone jack with an enclosed Switchcraft or Neutrik Tip-Ring-Sleeve (TRS) stereo type. I would avoid the simple open-frame jacks. Feed the R-4C output audio to both L and R channels. Now, you'll never need a mono-to-stereo adapter. If you have an old set of phones with a Tip-Sleeve plug, that will require replacement with a TRS type plug -- or use an adapter in those rare instances.

Paul, W9AC

> I completely agree. I purchased an FS-4 new in the late 70's. Used it with an R-4B for tropical band DXing, Utility DXing, general shortwave listening. It was the only disappointing product from Drake that I ever owned and a definite downgrade from band crystals in the 4 Line. In addition to the noise that came over on the cable to the crystal sockets, it radiated lots of garbage from the AC cord that my wire antenna could hear. I was able to reduce some of the radiated noise by adding bypass capacitors to the AC cord, but not nearly enough. Still have an R-4A, an R-4B and an SPR-4, but no FS-4.
>

Hi Bill,

You & Gary have made me feel so much better now, by my passing-up on the $75.00 FS-4 like I did here a coupla years ago...

Seriously!

Larry -

I don't have a transformer, but fyi the p/n is CT-686-A, and the Drake number is 369-100. Your want on this list is seen by 1000 Drake people, so you should be able to come up with one.

With your upgrade, where do you obtain the 'ANTI-VOX' output? The
Drake transformer has a third Hi-Z winding for this.

Of course, if the R-4C is in mint condition, any mod should be made so that it's reversible with no "residue" left behind. There are several possibilities:
>
> 1) Use Sherwood's AMP-4 kit. Or, build your own using a LM380/LM383/TDA-series audio amp. When using any of these devices, my experience has been that hum/buzz rejection is greatly improved with wiring care, but residual hiss may be objectionable when using modern headphones. You can use an in-line headphone attenuator and dial-in the amount of attenuation that reduces hiss to an acceptable level. Of course, as a trade-off, the amp is working harder and the source Z into headphones increases but this is rarely a problem. Radio Shack and on-line sources sell these. Any of the changes below will also result in reduced cabinet heating.

> 3) Construct a simple push-pull audio amp using low-noise transistors. For ultra-simplicity, I like the KK7B design that uses headroom boosting emitter caps. See http://www.qrp.pops.net/af-amp-2008.asp ;
>
> 4) Construct a low-noise, precision Class-AB amp using one of several designs. Generally, these designs use 2-3 biasing diodes to allow a small amount of collector-emitter current to flow in the absence of an input signal. These designs run very cool and have very low noise/distortion characteristics, owing to the use of the diodes and low-noise-figure transistors in the high-gain stages. I'm using the SM0VPO amp design. The circuit board is available from FAR Circuits and component values as well as the schematic are available on the SM0VPO website.
>
> If you primarily use modern stereo headphones, consider replacing the mono headphone jack

with an enclosed Switchcraft or Neutrik Tip-Ring-Sleeve (TRS) stereo type. I would avoid the simple open-frame jacks. Feed the R-4C output audio to both L and R channels. Now, you'll never need a mono-to-stereo adapter. If you have an old set of phones with a Tip-Sleeve plug, that will require replacement with a TRS type plug -- or use an adapter in those rare instances.

Larry,
I just checked the webpage of the fellow I bought my power transformer, for the R4C I rebuilt last year. He has it for $14USD.

Garey,

I moved C104 (0.01 uF) right to the amp output. I don't recall how Sherwood does it with his AMP-4 kit but it's likely the same.

The same method can be used in the R-4B (after upgrading the PS), using C122 and keeping R/C filter termination of C204/R95.

13223. TR-7 howling

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-15 16:32:36 UTC
From: John Sehring
Topic: 13223 Message: 13223

Howdy,

Statement made here that 1N4007 diode is different from others in this line, having a PIN-type junction.

Looking at link for 1N400_ below, I don't see any of that:

 https://docs.google.com/viewer?a=v&q=cache:s48Yjf69IzYJ:www.diodes.com/datasheets/ds28002.pdf+1n4007+diode+spec+sheet&hl=en&gl=ca&pid=bl&srcid=ADGEESgMYYjK4CaumC48BZA-Jmwn1p7-qeeMbwnGJl_rb8r6alUMZe0QgQsT0MMwrydxvE259oz6qp_mx-UpCKIZ-1UiBMV4oUJsLlpKyln7TMW7Euu6gzhHMm3xPvD-wfQf71OF5na7&sig=AHIEtbTCIjaaURN7NZzMN_7x5dK4oqwIrQ

only that the 1N4005 to 1N4007 have a lower junction capacitance vs. applied voltage characteristic than 1N4001 to 1N4004.

So...whatsay?

From: John Sehring
Topic: 13224 Message: 13224

I could not agree more with you!

Absolutely the best place to spend $$ is on the antenna. This fact is hardly on the mind of most. They think they need megabuck radios--not!

A friend just put Drake Twins on the air. His comment, funny thing, these radios hear just as good as my IcYeasWood expensive radio.

Yes, within its limitations, the R-4B is just fine, IMO. Of course, less so in contests. I find a good external DSP-driven audio filter is very useful on these radios. I use the Timewave 59+, are now pretty cheap used.

And you can fix the radio yourself.

Basically, I don't want anything in my shack that I cannot repair!

Too bad about slim ham population. Yes, no QRM but lonely, no? I've lived in the most sparsely populated places in North America. We had 3 hams in whole county, size = 100 mi. x 100 mi. One moved away, one SK'd, well...

>A friend in the UK keeps on at me to buy some new gear, but it is so expensive in NZ its unreal and no back up service of any value, >so why should I get a FT1000 or better at 10 times the price and zero times the repairability. Reckon the best place to spend money is up in air on antennas. Will see if I can catch this one, and report back.

>A good Datong audio filter sorts out many of the audio issues.

>Also not a great Ham population up here, think I am the only one on HF within 30 or 40 miles, so no nearby problems.

John -

I don't know where itwas first mentioned, but it was a 'reliable'
source. My understanding was that it was ONLY the 1N4007 that used
this internal structure. I believe they were used in a few
manufactured transceivers before 'real' PIN diodes came down in price.

Perhaps it's not mentioned in data sheets because it has no relevance
in rectification.?

John -

Your post got my curiosities up. It appears that the internal structure of the 1N4007 is 'similar' to the structure of true PIN diodes. The diode has a wider than typical intrinsic area between the P and N of the junction, which amongother things, reduces the capacitive coupling in the OFF state. Elecraft is one manufacturer who used them as RF switches in the K2.

Clifton Laboratories did a pretty complete evaluation of the 1N4007 and some other diodes.

<http://www.cliftonlaboratories.com/diode_turn-on_time.htm>

I interpret the results as 'it works, but not as well as a "real" PIN diode!' Kinda what I thought.....

Interesting
I know an old time op that designed and built a QSK tr switch around the 1N4xxx diodes, and a lot of other components and transistors. I have a schematic---someplace around here
He used it with OMNI VI and the 30S-1 linear. He claimed the OMNI was only rig that could keep up with him and the rig topped out at 87wpm. I have seen him operate and it is pure pleasure to observe.
Navy telegrapher (ret) in sub marine service. You may know him, Lyle, lives in Galesburg IL.

Amazing! Was telling the XYL about quigs and what they were for and what they looked like. Today she brings down a wooden jewelry box that I got at a yard sale 20 years ago with little divider trays inside, and said, "You never did tell me what all these little springs are for!"
There were 144 quigs!! I quickly and appreciatively appropriated them for my use...giving her three more little sections in her jewelry box to fill....but I still need to glue her ear-ring back together.

A great day!

Very Interesting to read this, have been using these for some time now (home brew ones) but discovered our local sewing shop sold them as part of their range of jewellery or more specifically drop earring components. Have yet to see if they are solderable but the lady says they are silver plated so should be OK. Would therefore assume that most hobby shops that deal with beads and that sort of thing would keep them.

Bernie,
You do realize, that means you'll now have to buy her jewelry, to fill the empty spaces. Fortunately, for you, that gold and silver tanked, today. Jewelry should be a steal, at the current market prices.

In tough economic times, like we are currently experiencing, it is purported to be beneficial to invest in precious metals, like platinum, gold and silver. Personally, I choose to invest in blued steel, brass, and copper jacketed lead.

Sent from my relatively bright, electronic leash.

Bob,

K9EW has developed a PIN T/R switch for use with his boatanchor QSK system:

http://www.k9ew.us/images/baqsk_tr_switch.jpg

Notice that he's using 1N4007 diodes with 135VDC bias. As transmit power is increased, the diodes require a further increase in bias voltage. This is important to offset the effects transmission line voltage with moderately high SWR. In the Ameritron QSK-5, true PIN diodes are use along with about 800VDC bias so the diodes stay in conduction at the 2KW power level.

Paul, W9AC

13235. Re: [DrakeRadio] 1N4007 as PIN Diode

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-16 02:06:29 UTC
From: Paul Christensen
Topic: 13223 Message: 13235

I had almost forgotten that K9EW's PIN T/R circuit originated with an article written for Ham Radio Magazine in the mid '70s:

Boomer, J.K. (W9KHC), "PIN Transmit/Receive Switch for 80 - 10 Meters," Ham Radio, May 1976, p.10. The Schematic from that article is shown in the link below. K9EW then substituted 1N4007 diodes for the Unitrode UM4004 PIN type as described in W9KHC's HR article:

http://www.seekic.com/uploadfile/ic-circuit/2009713232225121.gif

Another article that may be of interest is from W6RM. This construction article describes a complex syllabic vox system.

Hithcock, R.W., "VOX System for Drake Equipment," Ham Radio, August 1976, p. 24.

Anyone getting this far may want to read a series of QST and HR articles by Romel Hildreth, K0HZF, that began in the early '60s and conclude in the late '70s. It's interesting to read through the evolution of Hildreth's quest for fast QSK/VOX with his S/Line gear. At the end of it all, he had perfected what amounts to a near full-duplex switching system using classic separates.

Paul, W9AC

Interesting to note that the circuit linked looks a lot like what I remember Lyle's looked like---except this one is easier to follow!
Also Lyle had some circuitry to key the screen on the 4CX1000

Hi,

Do I have any hope at all in finding a functional
Drake Aux-7 board?

Let me know what you think.

Thanks,

Jon

Your best bet is to find a rig that has one. Otherwise, they can be found occasionally, but be prepared to pay a premium price. There have also been a couple of clones offered over the years, also not cheap. Or, you can roll your own (without the fixed frequency crystal feature):

http://www.wb4hfn.com/DRAKE/DrakeArticles/TechTips/Homebrew_AUX-7.htm

You can also "fake" an AUX-7 by adding arrays of diodes on the bottom of the parent board, but that gets ugly really fast. Really only practical if you want to add LF 0-1.5 MHz coverage.

It you need the fixed frequency crystal operation feature, you are pretty much stuck with the original AUX-7 unless you want to go to the added trouble of building it.

W7VH
Jon,
I happen to have one in its original box. If interested let me know.

Functional is another subject. It has sockets for six crystals if you
want to go that way.
Or you could build the modules (14 pin dips), each one of which would be
for a different frequency range.
Or you could purchase modules (most do). One source for the modules would
be.

http://www.marketworks.com/StoreFrontProfiles/default.aspx?sfid=86409

A second source would be http://www.Radiolabworks.com , look under
products.

Topic: 13228 Message: 13240

I just wanted to comment that like others on here, I've also made my own quigs and they work out pretty good. I just wind them on a drill bit shank sized for the connections I need to make, winding some buss wire on it.

I have not had great experience unsoldering components from solder lugs without damage, so if I can't get the existing component lead out, or slip a new lead in the lug, I'll cut the component and leave some lead length, and use a quig. 73, Scott WA9WFA

Can some Curve trace test help in this, I don't have mind as yet, I'm waiting for PEAK to ship it, but it would be interesting to know, I know a number of components can sub in areas that thee data sheet don't mention as (Garey mentioned) because the designed purpose has no interest in that data,

Maybe I can do some test by using a TG and SA and compare a mpn3404 and a 1N4007, and see what the attenuation of both are,

Hi Peter,

Thanks for th3e advice. I ended up with a different TR7
and it just happens to have an FL-6000 in it so I'm set.

I just have to find a narrow CW filter. It already has
an INRAD 1.8 sideband filter as well.

Thanks,

Jon

I'm not one to criticize someone for making a buck, but I made my own modules. Some of the prices I have seen for a DIP header with a few 1N4148s soldered to it seem a little high. Of course, it helped that I had DIP headers and diodes on hand, but the part are cheap.

Same here. I bought my TR-7 new with aux-7 board but made my own modules. They work perfect. All you have to do is get a bunch of IC headers. (They are the male plugs that plug into an IC socket. They are made to solder parts onto the back side. They cost a few cents each. You can use the cover over them or not use covers at all). The truth table tells you how to wire the needed 1N914 diodes for any given band segment. Of course the 1N914 diodes cost just a few cents two. In other words you can quickly make up any module you need in very little time which costs pennies each to make. I can't imagine paying big bucks for them when you can build them for next to nothing quickly.

I didn't bother with covers on my DIP headers. The came off of surplus PCBs, and most didn't have them anyway. My work is neat enough that I WANT the next guy to see it. :) 1N4148s are common as dirt (and almost as cheap), and tend to be a little smaller than 914s I think. I Still have lots of them, also surplus, in a can of "stuff" given to me at a previous employer. The only cost was my time.

Garey - the 2B Service Supplement CD arrived on Monday (very swift service!)

Boy - what a lot of great information packed onto 1 CD. I've been looking on eBay for 2B's and already had to let one go, as I just can't justify the expenditure right now. I've been stocking up the parts bin lately for other projects and have to control myself sometimes. As far as 2B's go, I will want one in nice condition - particularly the copper-plated chassis and of course, those 2B's tend to command good prices.

I have even been tempted by an SW4-A in non-working condition as an ongoing project (as I like the SWBC bands too) but am not sure how much info there is out there about the SW-4A. I know it's not one of the best receivers out there from it's era, but I'm still curious.

So thank you Garey. I'll let you guys know when I finally become a Drake owner. It could be a while, but that Service Supplement CD is providing the extra motivation!

Aldo,
If you go to Ron's web page, at www.wb4hfn.com you will find an article on painting cabinets, including the spacking. Good luck and take your time when painting. It's much better to do it the correct way the first time than have to go back to step 1 and do it again.

73's,
Mark

Thank you for all the info. I will be looking to see if I can find the paint up here. I the mean time I picked up another piece of Drake equipment to go with my TR-4C, it is coming from Quebec and I should have it here. It is a RV-4C which is in excellent shape, just one small scratch on the one side. anyway thanks again to all for your help.

Garey,

Here is the work that I have done this week and their results. I have a number of questions that will be included in the text.

I have found a number of areas that were mucked around in; I do not know what they were trying to accomplish and the mechanical connections were behind a number of problems. Some of the wiring I cleaned up as it just looked horrible, some I redid to repair questionable solder joints.

T7 and T9 had been removed at some point, for what reason I do not know; T7 looked like it had been rewound when I pulled the can off. As I had posted earlier, while trying to peak T9 top (20M section) the screw didn't feel right and I was not getting the S-Meter to peak properly. I removed it and found that the tuning slug was missing with a little piece of it broken, laying in the bottom of the tube. I removed T-9 from a TR-4c parts rig and installed it. When I attempted to peak T-9, I could only get 2 S units with the slug screw turned all the way in. I removed it again and pulled the can off both T-9 units that I had. The original can had a capacitor inside the can across the two pin side where the replacement did not. I took the good 20M tuning slug and installed it in T-9 that has the cap and had the missing slug and reinstalled. When I peak it now, I have 4 s-units with the slug screw all the way to the top however, the s-unit level never dips back off like the others do when you go past the sweet spot. 80 and 40 peak well over 30db over 9. It is at the top of its adjustment and very much seems like it need to be screwed out more. It seems as if the tuning slug is too long and needs a shorter one. What are your thoughts here? I also replaced T7 with the one out of the parts rig. All bands appear to peak as expected except for 20M.

Adjustment of injection couplers - I did not use the load as described in the alignment manual, I did the tuning without it as I did on my TR-4CW. All peak as expected however; T-1 will not peak to show any S-meter readings, I can peak it for a higher tone, but no s-meter readings.

Adjustment of balance modulator - When I short the PTT on the mic jack, I cannot develop any current above resting current; carrier balance or T-14 have no effect. The carrier balance pot does not have a stop point and does not look like the pot in my other rigs. This may have been replaced?

Transmit - R76 the resistor that goes through the chassis at T-14 had been replaced at some time. A bunch of wiring was apparently removed to get to it. I found several cold solder joints and the most important one from Pin 1 of V15 to C168. After making these repairs, I am able to tune 200 watts on 80, 40, 15 and 10M. 20M will only tune about 30 watts, I assume this is related to the T-9 problem? The tuning is very flaky though; with the XMTR gain fully counter clockwise, plate current is .5 to .6. I have to advance the XMTR gain to get the current to come down, then I can dip the plat and peak RF tune,then load up properly. The plate air variable and loading air variable are very touchy. Tuning is a bit erratic. I've looked closely several times and none of the plates are touching. In

addition, they do not move nearly as smooth as my other drakes; it almost like when the PTO bearings need greased.

The issues that need to be addressed, my assumption anyway;

1. Receive on 10M, 20M is very low. I get little to no s-meter reading and have to have the volume almost all the way up to hear a signal.

2. Loading up the transmitter is very erratic.

3. 20M will only produce little output power.

I have not attempted to transmit on the air yet. There have been horrible electrical storms in the area. I can transmit into a dummy load and monitor myself on another receiver. The audio sounds as good as I can tell it should. The plate meter moves with my voice as it does on my other rigs, and on 80 and 40M, my peak reading wattmeter deflects to about 200Watts. The S-meter does not deflect downward as it does on the other rigs like the AGC is not working though.

Your input is greatly appreciated. I apologize for the lengthy amount of text however; I felt the more information I could provide might help determine where to go next.

Regards,

Doug N9XTF

At last. Someone who agrees with my findings
I've been saying that for years and just get "corrected" like I didn't know what I was talking about.

Krylon 1613 was discontinued years ago. It appears to have been a more lacquer based product, very nice to work with, and a perfect match to Drake. I suspect it was discontinued because of changes in regulations affecting voc in paint.

Krylon 51613 that some say is same---is not---it is glossier and not even close in test panels I did.
Some places on the internet list 1613 on search, collect your money and ship 51613. They don't have a clue what happened. Krylon says it is a substitute. You end up with more cans of 51613 for free that are just like the ones you got at WalMart for half the internet price with no shipping. Hey, at least you get your money back and free paint.

The EZ touch spray nozzles do not respond same as old nozzles that could be drilled out to spatter. They tend to spray more uniform regardless of light touch. Try to drill them and you get paint drool not spatter.

What to do? I found just using the Krylon flat and buffing with soft cloth dampened in mineral spirits lets you come up on the desired degree of satin so you can emulate and old 2B (which is not spattered) and a recent 4 line product so you can make the new look like the rest of the gear on the table.

How to spatter with a spray can? Practice X 3! When it comes time to do the final deed on the cabinet I work on a large shhet of cardboard, get the spatter going about right and try to move over the product without changing the spray pressure either finger or the clamp on handle accessory.

Options? Invest in a low cost HVLP spray rig from Harbor freight and get paint mixed at someplace like Sherwin Williams that does industrial finishes. Or, if you are going to do every Drake you own and just want a nice matcing finish just take them out someplace, have them stripped, bead blasted, powder coated satin black and be done with it. We have access to a lovely satin black powder coat right here in the stix.

Doug-

OK, progress is good! That's something that I tend to take for granted, and I shouldn't. The first two steps should be to go through checking all the hardware for tightness, and as you go, inspect for changes, bad solder broken pieces, or anything else that doesn't 'look right'. "I" do that automatically and need to encourage others to do the same.

Anyway!!

Typically, either it was being, or attempting to be modified for CB service.

1. The coils and transformers are designed to operate as a resonant circuit. I would select the T9 that looks 'original', and change the internal capacitor for one that allows the slug to peak near the center of it's range. I don't remember what kind of cap Drake used, but it needs to be either a mica or NP0 ceramic. If itadjusts to maxwith the slug all the way out, the capacitor needs to be a bit bigger.

It's best to use the alignment load to ensure that the proper bandwidth is achieved. Several iterations of the adjustmentscan approach the correct tuning.

3. It's been a while since I've worked on a TR-4, but I believe thatT1 is very broad tuning, especially without the alignment load. Since it uses the Calibrator signal, I'd suggest trying another harmonic as there can be quite a difference between alternate harmonics.

The newer models of the T-4X and TR-4's do not have enough out of the Balanced Modulator 'at its worst' to increase above idle current. Easiest is to connect an external receiverto a loop consisting of a few turns of insulated wire and place it near the PA under the chassis. Tune in the 9 MHz Carrier Oscillator, peak T14 and then adjust Carrier Balance for minimum signal. You should be able to get it down into the noise of the receiver.

2. This sounds like instability in the PA. Check the grounding of the TUNE and LOAD controls. Clean and DeoxIT the grounding springs on each end of the capacitor shafts. If hardened grease in the bearings, clean it out and replace with Lubriplate or other light grease. Check the neutralization of the PA. 15M would be a good place to start, carefully dip the PLATE control for minimum plate current, and note output on external power meter. Then turn the PLATE control in either direction 'out of resonance' while watching the output power. IF the output power goes UP when the PLATE control is turned either way out

of resonance, the PAis not properly neutralized. If it's close, you
can try adjusting the neutralization capin the PA (C76) just a few
degrees one way or the other, and recheck. If the power goes UP
'more' adjust C76 a few degrees back and then a few MORE degrees and
recheck. This can be a frustrating operation, and if you find you
can't hit it, remove the DC from the Plate and Screen terminals on the
outer side of the underchassis shield. Then listen to the ANT output
of the TR-4 with your external receiver and adjust C76 for the dip.
Becareful with the terminals onthe PA shield, especially the Screen,
as the ceramic caps WILL crack or break if too much stress is applied.

Sounds like you're getting close!

>
> I have found a number of areas that were mucked around in; I do not know what they were trying to accomplish and the mechanical connections were behind a number of problems. Some of the wiring I cleaned up as it just looked horrible, some I redid to repair questionable solder joints.
>
> T7 and T9 had been removed at some point, for what reason I do not know; T7 looked like it had been rewound when I pulled the can off. As I had posted earlier, while trying to peak T9 top (20M section) the screw didn't feel right and I was not getting the S-Meter to peak properly. I removed it and found that the tuning slug was missing with a little piece of it broken, laying in the bottom of the tube. I removed T-9 from a TR-4c parts rig and installed it. When I attempted to peak T-9, I could only get 2 S units with the slug screw turned all the way in. I removed it again and pulled the can off both T-9 units that I had. The original can had a capacitor inside the can across the two pin side where the replacement did not. I took the good 20M tuning slug and installed it in T-9 that has the cap and had the missing slug and reinstalled. When I peak it now, I have 4 s-units with the slug screw all the way to the top however, the s-unit level never dips back off like the others do when you go past the sweet spot. 80 and 40 peak well over 30db over 9. It is at the top of its adjustment and very much seems like it need to be screwed out more. It seems as if the tuning slug is too long and needs a shorter one. What are your thoughts here? I also replaced T7 with the one out of the parts rig. All bands appear to peak as expected except for 20M.
>
> Adjustment of injection couplers - I did not use the load as described in the alignment manual, I did the tuning without it as I did on my TR-4CW. All peak as expected however; T-1 will not peak to show any S-meter readings, I can peak it for a higher tone, but no

s-meter readings.
>
> Adjustment of balance modulator - When I short the PTT on the mic jack, I cannot develop any current above resting current; carrier balance or T-14 have no effect. The carrier balance pot does not have a stop point and does not look like the pot in my other rigs. This may have been replaced?
>
> Transmit - R76 the resistor that goes through the chassis at T-14 had been replaced at some time. A bunch of wiring was apparently removed to get to it. I found several cold solder joints and the most important one from Pin 1 of V15 to C168. After making these repairs, I am able to tune 200 watts on 80, 40, 15 and 10M. 20M will only tune about 30 watts, I assume this is related to the T-9 problem? The tuning is very flaky though; with the XMTR gain fully counter clockwise, plate current is .5 to .6. I have to advance the XMTR gain to get the current to come down, then I can dip the plat and peak RF tune,then load up properly. The plate air variable and loading air variable are very touchy. Tuning is a bit erratic. I've looked closely several times and none of the plates are touching. In addition, they do not move nearly as smooth as my other drakes; it almost like when the PTO bearings need greased.
>
> The issues that need to be addressed, my assumption anyway;
>
> 1. Receive on 10M, 20M is very low. I get little to no s-meter reading and have to have the volume almost all the way up to hear a signal.
>
> 2. Loading up the transmitter is very erratic.
>
> 3. 20M will only produce little output power.
>
> I have not attempted to transmit on the air yet. There have been horrible electrical storms in the area. I can transmit into a dummy load and monitor myself on another receiver. The audio sounds as good as I can tell it should. The plate meter moves with my voice as it does on my other rigs, and on 80 and 40M, my peak reading wattmeter deflects to about 200Watts. The S-meter does not deflect downward as it does on the other rigs like the AGC is not working though.

Been reading a similar issue on the Corvette forums. Owners there say that the original Krylon 1613 formulation is available only through industrial suppliers like MSC Industrial. According to them, the correct can has the old square top cap and not the newer rounded bullet style. The can will also state "Not for Retail Sale." I just ordered a can. If it's the right one, great. If not, it will be used for some other household application.

Doug -

One other thing. Compare your repaired areas with the photos inthe
CD. Some of the wiring, especially in the PA and CO area is
critical. This is the best way to make sure everything is back where
it should be!

That would be great.
When I called SWP makers of Krylon they told me no longer available.
I ordered some from one of the internet stores that showed the old can and old number and received 51613 and when I called back I got a bunch of "I dunno I just sit here at my computer and do what it tells me on the screen".
Got a refund and told to keep the paint. They wouldn't pay the shipping to get it back.
Also FWIW---1613 does not mix and play well with other finishes. I had a can left and tried to go back the other way. Had to strip everything to bare metal and start all over.
I think it is government regulations at work to save the state of CA.

Paul is correct about the Krylon Paint. I looked at the local hardware for 1613 but could not find it in the can I purchased color 51613. I was looking for flat black and this is a satin black. That is all they had however so going on getting the job done I purchased the 51613 can. Looking on the internet at the hardware store we could not find 1613 as well.

Now that being said I recently painted a 2B cabinet. Following what Paul stated about not being close in color I held up a T4XC I have here(I have lots of Drake gear) to the painted 2B and can tell you it is difficult for me to tell the difference, for me it is that close. I would say the new paint may have a bit more satin tone but side by side, at least in the lite I have in the shack they are very close, I would not say the same but so close that for me after looking at the two side by side and holding one next to the other it is close at least.

Anyway that is my story.

At last. Someone who agrees with my findings
I've been saying that for years and just get "corrected" like I didn't know what I was talking about.

Krylon 1613 was discontinued years ago. It appears to have been a more lacquer based product, very nice to work with, and a perfect match to Drake. I suspect it was discontinued because of changes in regulations affecting voc in paint.

Krylon 51613 that some say is same---is not---it is glossier and not even close in test panels I did.
Some places on the internet list 1613 on search, collect your money and ship 51613. They don't have a clue what happened. Krylon says it is a substitute. You end up with more cans of 51613 for free that are just like the ones you got at WalMart for half the internet price with no shipping. Hey, at least you get your money back and free paint.

The EZ touch spray nozzles do not respond same as old nozzles that could be drilled out to spatter. They tend to spray more uniform regardless of light touch. Try to drill them and you get paint drool not spatter.

What to do? I found just using the Krylon flat and buffing with soft cloth dampened in mineral spirits lets you come up on the desired degree of satin

so you can emulate and old 2B (which is not spattered) and a recent 4 line product so you can make the new look like the rest of the gear on the table.

How to spatter with a spray can? Practice X 3! When it comes time to do the final deed on the cabinet I work on a large shhet of cardboard, get the spatter going about right and try to move over the product without changing the spray pressure either finger or the clamp on handle accessory.

Options? Invest in a low cost HVLP spray rig from Harbor freight and get paint mixed at someplace like Sherwin Williams that does industrial finishes. Or, if you are going to do every Drake you own and just want a nice matcing finish just take them out someplace, have them stripped, bead blasted, powder coated satin black and be done with it. We have access to a lovely satin black powder coat right here in the stix.

From: slowcountry1
Topic: 13108 Message: 13265

Garey,

I've noticed that there are several things different between the picture on the CD and the rig. Were there some differences between the rig serial numbers that would explain that? I know there are some slight differences in the schematics.

On the 26000 schematic, I do not see a capacitor that would indicate that it is inside T-9. Is this typical? I looked at the cap but it did not have a value on it, it is a ceramic disc type. I can check it with my meter. I'm really getting tired of removing and installing this can, its in a really tight place for soldering and unsoldering, LOL.

I was thinking of installing it external to the can to facilitate trying different values. I imagine that this will effect tuning if I do so, what are your thoughts here?

It had crossed my mind that some magic screwdriver may have used this on 11M, but the crystals in it are all for 10M. This is not to say someone did not try to restore it to operation.

In addition,It was stored in less that ideal conditions; moisture and some other junk were allowed in the radio. Whomever worked on it did not understand mechanical or basic soldering techniques either.

Regards,

Doug N9XTF

Doug -

It is not unusual for there to be caps and resistors inside transformers. I suppose if it's not marked it may be a bypass or no telling. I suspect what has happened is that someone tried to move it to CB and failed, and then either that person or someone else has tried to return it to stock.

You can certainly mount the cap on the terminals on the outside of the transformer. There may be some coupling problems, but I doubt it. Certainly worth trying until you find the right one. Sometimes these caps are selected to account for variations in coil windings, plus ferrites were not nearly as consistent from batch to batch as they are today. Once you find a suitable value, I'd move it inside the can just to be safe. Be sure and use stable capacitors such as silver mica or NP0 ceramic types. I wouldn't expect it to be morethan 10's of pFs, but I could be wrong. If you are able to measure the existing cap it would give you a starting point.

It's certainly possible that a model had a different layout, although I've not seen any significant variations. If you look in the 'Versions' directory, there are a couple of Drake photos of different models that may help determine if something is abnormal.

The article on Ron's web page is correct and has the correct Krylon paint number. I'm surprised no one has even been there to check.

http://wb4hfn.com/DRAKE/DrakeArticles/TechTips/CabinetRepainting.htm

Also, someone had also mentioned the spackling will not work with the new heads. That's not correct. It works as well as it did with the previous paint, maybe better. I've painted dozens and dozens of cabinets using the newer paint and every one has been spackled the same. So I would be interested in knowing what difficulty there was spackling using the new head?

Regards,
Mark

Well I am now the produ (I hope) owner of a TR4 RV4 AC4 and a shure 444mic for the total of $250NZ that is $207 US, plus I have to get it here, that will take a bit of ham intervention I hope to get it closer then I can go and pick it up.

I am fortunate at the moment having 15 acres of flat land, and just coming to 65 so easing off a little bit, that the time for hamming is back in my life.

i hope the TR4 looks good alongisde the B & C line, have got a 75A4 that I have owned for 50 years that needs recapping a new dial sticky on it.

But I see these people spending 6 or 7k on a rig in a el cheapo vertical, and I do wonder what is the big idea.

Regards to all

Oh just built my Winkeyer and got that working so life is looking up :-)

Gavin,

The TR4/RV4 will look great alongside the B and C lines as well as the 75A4. Let us know when you are on the air and hearing U.S. stations, and I for one will fire up some Drakes and give a shout!!!!! I have both the B & C lines, and a TR4C, all of which will drive the L4B and with the 4 element Cubex, SHOULD make it to New Zealand, hi. Great fun and glad you got the rigs.

Let us know when you are on the air and hearing U.S. stations, and I for one will fire up some Drakes and give a shout!!!!! I have both the B & C lines, and a TR4C, all of which will drive the L4B and with the 4 element Cubex, SHOULD make it to New Zealand, hi. Great fun and glad you got the rigs.

13273. SPR-4 TA4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-19 11:52:32 UTC
From: taner@btinternet.com
Topic: 13004 Message: 13273

Trying to repair the unit but I just discovered that there is a audio type transformer fitted which is not on SPR-4 diagram.
Done some search and it seems that a TA4? was fitted sometime in the past.
So that the receiver can be linked to a transmitter.
Looking at the circuit diagram of TA4 and the installation notes (found on the net)I can not work out what this add-on does exactly.

Does the receiver bypasses its PTO and/or the Xtal Oscilators ?.

In any case I only want to use this SPR-4 for SWL so what is the quickest way to remove/disable this add-on (if it needs to be)?

Thanks,

The article on Ron's web page is correct and has the correct Krylon paint number. I'm surprised no one has even been there to check.

The original article had the old number "semi flat", and if you got used to using that the new shade of 51613 is different. Frankly old eyes will probably not spot enough difference unless you put under a fluorescent side by side original to repaint, not talking about spackle.
Yes I had problems with the "swivel" nozzle, it dribbled badly. Carl wd8nhk

JT -

Hard to say what the transformer might be for without knowing where it's connected.

I can explain the TA-4 operation, and make a guess what the transformer MIGHT have been for.

The Drake 'Twins' enabled transceive operation with either R or T PTO (VFO) controlling both units, or each controlling its own. A brief description of the twins circuit topology is that the PTO (~5 - 5.5 MHz) is 'Premixed' with the BAND oscillator (18.1 MHz for 40M), resulting in an LO for the 1st Mixer of ~13 MHz. This signal is then mixed with the 7 MHz incoming signal, resulting in the 1st IF of 5.645 MHz. The transmitter uses a similar scheme, except the ~13 MHz Premixer signal is mixed with the 5.645 MHz Carrier Oscillator to produce the 7 MHz output signal.

For transceive control of the pair from the Receiver, the Premixer in the transmitter is disabled by a switch contact, and the Premixer signal from the receiver via the INJ cable is applied to the 1st Mixer in the transmitter. When control of both by the transmitter is desired, a negative voltage of about -30 VDC to disable the receiver Premixer stage is sent via the INJ cable, along with the transmitter Premixer signal.

What the TA-4 accessory does is emulate these functions by various semiconductor switches. The transformer you have is 'probably' a voltage step-up from the 4 ohm audio output of the SPR-4 (picked up at the PHONES jack) and matched to ~3-4 k ohms to supply the ANTI-VOX signal to the T-4X.

That makes sense,

I was not able to see the TA4 board where it is suppose to be,so without tracing back the wires,in detail,to see where there are connected to,it may be as you said , is a step up transformer of some sort.
It has 6 tags on it.The speaker output appears to be connected to one of the wires of that transformer.Because the audio board was badly ""repaired "" I could not rely on the integrity of the wiring I am looking at.

What confused me more is the diagram I found,for TA4,which shows a transformer.But that one has only 4 connections.The one I have has 6.
On one side first and second tag are marked ,hand written p p,and one is connected to white and the other to a red wire, and the third one is earthed.
The other side has 2 wires,white and blue and white and green going to each side connectors but the one in the middle is not connected but had a wire soldered in the past but now cut-off?

On the back of the unit I have, there is a square shaped socket with 4 female connectors,but only 2 wires are soldered.

I guess I am 40 years too old and to late to work out how these drake series evolved.

But I am not going to give up,yet.

Many thanks,

From: Paul Christensen
Topic: 2620 Message: 13278

The Krylon 1613 arrived today. Fast overnight delivery from MSC Industrial in GA. It appears to be the "real deal." It's definitely labeled #1613, has the squared cap, old style nozzle, and disclaimer that reads "Not for Retail Sale."

MSC Industrial Part No. 00264671. USD $6.60 + shipping.

With the right paint in hand, I just wish I could trust my painting skills.

Paul, W9AC

Been reading a similar issue on the Corvette forums. Owners there say that the original Krylon 1613 formulation is available only through industrial suppliers like MSC Industrial. According to them, the correct can has the old square top cap and not the newer rounded bullet style. The can will also state "Not for Retail Sale." I just ordered a can. If it's the right one, great. If not, it will be used for some other household application.

At last. Someone who agrees with my findings
I've been saying that for years and just get "corrected" like I didn't know what I was talking about.

Krylon 1613 was discontinued years ago. It appears to have been a more lacquer based product, very nice to work with, and a perfect match to Drake. I suspect it was discontinued because of changes in regulations affecting voc in paint.

Krylon 51613 that some say is same---is not---it is glossier and not even close in test panels I did.
Some places on the internet list 1613 on search, collect your money and ship 51613. They don't have a clue what happened. Krylon says it is a substitute. You end up with more cans of 51613 for free that are just like the ones you got at WalMart for half the internet price with no shipping. Hey, at least you get your money back and free paint.

The EZ touch spray nozzles do not respond same as old nozzles that could be drilled out to spatter. They tend to spray more uniform regardless of light touch. Try to drill them and you get paint drool not spatter.

What to do? I found just using the Krylon flat and buffing with soft cloth dampened in mineral spirits lets you come up on the desired degree of satin so you can emulate and old 2B (which is not spattered) and a recent 4 line product so you can make the new look like the rest of the gear on the table.

How to spatter with a spray can? Practice X 3! When it comes time to do the final deed on the cabinet I work on a large shhet of cardboard, get the spatter going about right and try to move over the product without changing the spray pressure either finger or the clamp on handle accessory.

Options? Invest in a low cost HVLP spray rig from Harbor freight and get paint mixed at someplace like Sherwin Williams that does industrial finishes. Or, if you are going to do every Drake you own and just want a nice matcing finish just take them out someplace, have them stripped, bead blasted, powder coated satin black and be done with it. We have access to a lovely satin black powder coat right here in the stix.

That sounds like a transformer for a push-pull audio stage, and
probably one that the previous owner had on hand. Ham spirit, you
know!! :-) Just used half the Hi-Z winding and one of the Low-Z
taps. Should be safe to remove it.

I"ve done some spray painting, cars, boats, R4a, etc. This drilling the small valve hole and "spattering" takes practice. Distance, sweep speed, button press force, are all variables, in addition to the usual, temp. and humidity. Use a well lit area, maybe even a clear, windless day outside. Practice first on scrap sheet metal if possible. Shooting cardboard is not the same.

13281. Re: SPR-4 TA4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-19 16:49:36 UTC
From: taner@btinternet.com
Topic: 13004 Message: 13281

Because it is in such a state,it is impossible to know what has been added or removed from this old receiver.
I have wired in a 12V regulator and a stand by audio amplifier and got some band noise (and an unknown BC station on first band range (A).

So that I can trace any other faults which may or may not be there.

Having band noise and receiving a broadcast (adjustable with RF gain control)tells me that RF amp,first and second IF and the mixers are working.

When I switched the xtal range switch It was very quite,so because my assumption that a TA4 board was added at some later stage I assumed that the Xtal Osc injection was turned off,and the my SPR4 needed to be linked to a Tx to receive its Xtal Osc signal.

And only receiving a band made me think I was only receiving just one band = PTO +/- 5645.

What I want to do next is to inject an external DDS directly to the first mixer,so that i can check the alignement of the preselectors and the working of the range switch.

I am gratefull for your guidance and wisdom,I guess you seen all these (ham spirit) before.:-)

From: Garey Barrell
Topic: 13004 Message: 13282

OK. The manual has a complete description of the installation of the TA-4, so should be able to 'reverse engineer' those instructions to see what to undo.

The PTO runs from 5.455 to 4.955 MHz, with the highest frequency at the 000 end of the dial. There is NO crystal for BAND 0, 150 - 500 kHz, just the PTO directly to the 1st Mixer. If you only have one band, it's likely that the BAND oscillator isn't running (Q2).

Functions of the TA-4 include disabling the BAND and Premixer stages, and if it was just 'yanked out' the controlling lines of those stages need to be reconnected to ground or B+ as appropriate.

That is NOT how the warning is worded, it is: This
product contains substances which are known by the State of
California to cause cancer". There is a similar warning on
businesses here that use cancer-causing materials.
Wait until someone you love comes down with cancer or
are diagnosed with it yourself, it will change your mind
about nanny state control of cancer causing substances.

Well that is great news Paul
I will order some as well
Thank-you for finding the real deal
Now it will probably be out of stock

Richard
That has indeed happened to many I know. May they RIP
Most led pristine lives away from all bad influences, no smoke, drink, bad food, bad environment
Many more I know that are alive and well have paid no attention to any cautions
My belief is that God wills, people accept.

13286. Re: [DrakeRadio] Re: SPR-4 TA4

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-04-19 19:28:32 UTC
From: HUTaner
Topic: 13004 Message: 13286

I dont think I explained myself correctly.

Looking at the machine there is no AT4 board,I can see 2 holes on the chassis,to screw the board down.It is possible that they fitted the AT4 in the past then just removed it without reversing the mods.I dont know yet.
The reason I first thought there was one because of,
a-there is a fitted audio transformer (but does not match of that AT4)
b-quite bands when xtals are switched on (I assumed the non existing AT4) was disabling the xtal Oscilators.

Like you said on band 0 only the PTO in injected to the first mixer so you get reception on 150 to 500 Khz.
On the other bands Xtal Osc frequency minus PTO frequency,after filtering,is injected to the 1st mixer,so you get to receive other bands.

So I have to check whether the xtal Oscilators are oscilating and also there is an injection to the first mixer which is Xtal frequency-PTO frequency.

I think,with your help,now know the way the SPR-4 works with or without AT4 .So it is easier to either reverse engineer if needed or to repair the fault ,

Best regards,

Looking for one of these in nice shape. Would prefer an original. Not sure if Sherwood's are anodized or numbered like the original. Does anybody know?Thanks.

From: Garey Barrell
Topic: 13004 Message: 13288

Do you have the manual showing how to install the TA-4?? This will
show you what would have been there with it installed. From a
functional standpoint, that transformer connected to the speaker
output _IS_ almost certainly the one associated with installation of
a TA-4. I don't think it came with the TA-4 kit.

Probably sold the TA-4 in a 'separate auction' on eBay! :-)

Richard, you're probably right about what my label was SUPPOSED to say, but I'm looking at the one I took from the zip cord of something I bought a couple of years ago, and it definitely says "IN the state of California."

I've kept it to remind me how important language is - it's kind of a GIGO thing - sloppy writing often causes confusion instead of communication.

That is NOT how the warning is worded, it is: This product contains substances which are known by the State of California to cause cancer". There is a similar warning on businesses here that use cancer-causing materials.
Wait until someone you love comes down with cancer or are diagnosed with it yourself, it will change your mind about nanny state control of cancer causing substances.

Hmmm, reminds me of the statement I have seen in user manuals for Japanese gear:

"Specifications subject to change for an improvement without notice".

I always wondered why you would design an improvement that can't be noticed.

I just noticed that you bought the radio from a 2nd hand shop and not ebay. Mea culpa. I will back quietly out of the room with my head bowed low.

Sorry for the noise.

Subject: [DrakeRadio] Re: SPR-4 TA4

That makes sense,

I was not able to see the TA4 board where it is suppose to be,so without tracing back the wires,in detail,to see where there are connected to,it may be as you said , is a step up transformer of some sort.
It has 6 tags on it.The speaker output appears to be connected to one of the wires of that transformer.Because the audio board was badly ""repaired "" I could not rely on the integrity of the wiring I am looking at.

What confused me more is the diagram I found,for TA4,which shows a transformer.But that one has only 4 connections.The one I have has 6.
On one side first and second tag are marked ,hand written p p,and one is connected to white and the other to a red wire, and the third one is earthed.
The other side has 2 wires,white and blue and white and green going to each side connectors but the one in the middle is not connected but had a wire soldered in the past but now cut-off?

On the back of the unit I have, there is a square shaped socket with 4 female connectors,but only 2 wires are soldered.

I guess I am 40 years too old and to late to work out how these drake series evolved.

But I am not going to give up,yet.

Many thanks,
